“What do we mean by *honest* accounting software?”

We mean software that does what it says it will do; it works in the real world.

What does RealWorld™ accounting software do?

Our fully integrated accounting line offers General Ledger, Accounts Receivable, Payroll, Accounts Payable, Order Entry, Inventory Control and Sales Analysis as honest solutions to your accounting problems. Our software runs on most popular micro-computers.

RealWorld software has been designed to suit your business accounting needs. Our software is built on the actual live feedback collected from our dealers and users over the last ten years.

An installed base of over 80,000 satisfied users has kept us in touch with the true needs of business accounting in the real world. An independent survey of computer retailers rated us #1 in technical performance, documentation, user friendliness, features and adaptability.

See for yourself what RealWorld can do

Seeing is believing—go to your local computer dealer and get a live demonstration of our software. You can enter real data about your real life accounting problems and see the results for yourself.

Insist on the accounting software that does what it says it will do. RealWorld is available at most major computer stores, or call us direct for the number of the dealer nearest you. Or send us the coupon below and we will mail the information to you without delay.

COVER STORIES/FEATURES

In Praise of Unsung Heroes 104

*Bill Machrone/*At Spring COMDEX, *PC Magazine* gave out a series of awards to the all-important but little-recognized developers of computer technology.

Profiles in Technical Excellence 109

*Barbara Krasnoff/*Here's a quick glimpse at some of the people whose products bring the newest in technology into our lives, while they themselves remain behind the scenes.

PRO COLUMNS/DEPARTMENTS

WHAT'S INSIDE 15

PC NEWS 33

Fifteen pages of up-to-the-minute reports, interviews, and minireviews.

FROM THE EDITOR'S SCREEN Out of the Mouths of Babes 79

*Bill Machrone/*Learning to use the computer can be child's play—and a child's instinctive learning techniques can tell us a lot about how to teach adults, as well.

LETTERS TO PC 89

Readers from across the nation and around the world share their insights, comments, and questions.

THE NORTON CHRONICLES Striving for Practical Perfection ... 97

*Peter Norton/*In striving for the ideal "practical" PC, Norton makes a modest proposal for putting together the best possible microcomputer work station without throwing away money on fancy frills and extras.

PROGRAMMING How to Realize Cache Savings ... 207

*Steven Holzner/*If you want the speed and convenience of a giant RAMdisk but are stuck with puny memory, this disk "cache" technique may be for you.

SPREADSHEET CLINIC 213

*Jared Taylor/*Users pass along the fruits of their spreadsheet experience, including useful macros and templates.

SPECIAL REPORT

Focus on PC Training: Shaping the Learning Curve.....115

Kate Barnes/Since PC software is still a far cry from being intuitive or easy to use, companies need to train their employees to use computer resources effectively.

Computer Training: A Matter of Style.....121

Robin Raskin/The first step in learning to use the PC is to decide on the learning method. There is no one best way, so your decision should be based on your specific needs and resources.

The Small-Business Dilemma: Employee, Teach Thyself.....132

Loretta Holz/These five small companies use a mixture of creativity, self-motivation, and consultation to solve their computer training problems.

The Corporate Solution: Classes for the Masses.....140

Edward Joyce/Big corporations have big PC training requirements. Here's how some of them meet those needs.

POWER USER.....216

Charles Petzold/A special installment focusing on Borland's Turbo Pascal.

USER-TO-USER.....221

Paul Somerson/Readers share their tips and short programs.

PC TUTOR.....227

Mark Zachmann/PC Magazine answers readers' technical and nontechnical questions.

helps you access the huge Telescan stock database to do analysis graphs.

Compare the Hercules Color Card to IBM's.

Five reasons why the Hercules Color Card is better.

IBM Color Adapter \$244

1. Compatibility

Runs hundreds of graphics programs.

2. Printer port.

None.

3. Size.

13.25 inches. Limited to long slots.

4. Flexibility.

Can't always work with a Hercules Graphics Card.

5. Warranty.

90 days.

Hercules Color Card \$245

Runs the same hundreds of graphics programs. "The Hercules Color Card is so nearly identical to the IBM Color/ Graphics Card that it's almost uncanny." PC Mag.

Standard. Our parallel port allows you to hook up to any IBM compatible printer.

5.25 inches. Fits in a long or short slot in a PC, XT, AT or *Portable*.

Always works with a Hercules Graphics Card by means of a software switch.

Two years.

Any one of these five features is enough reason to buy a Hercules Color Card. But perhaps the most convincing reason of all is just how easy the Hercules Color Card is to use: "Right out of the box, the Hercules Color Card goes into an empty expansion slot, ready for you to plug in . . . and go to work—no jumpers, no software. For most applications, it's just that easy." PC Magazine.

Call 1-800-532-0600 Ext. 420 for the name of the Hercules dealer nearest you and we'll rush you our free info kit.

Hercules.
We're strong on graphics.

EVEREX EVER FOR EXCELLENCE

The Everex Hard Disk/Backup Systems Are Your Expansion Systems too... with little additional cost.

More Room To Expand, Not More Money

Think about Off-loading expansion boards from your PC or XT to an External Hard Disk/Backup System. Everex provides a complete line to choose from...

- Full-size system with eight expansion slots and room to add up to four hard disk/backup systems.
- Half-size system with four expansion slots and space for two hard disk/backup systems.
- Slimline system, only 2½ inches high with three full-size, one half-size expansion slots and room for two hard disk/backup systems.
- All Expansion systems are available with any combination of Everex hard disk drives and backup systems.

Unique Features

- One shielded round cable (as IBM) instead of flat ribbon cables.

Replace the clumsy flat ribbon cable with Everex's shielded, round cable

- Advanced design eliminates "wait states" for faster data transmission.
- Compatible with more controllers than other systems.

Visit your local Everex dealer today and ask to see Everex Hard Disk/Backup Systems in action. For the name of your nearest Everex dealer, please call (415) 498-1111, 47777 Warm Springs Blvd., Fremont, CA 94539. Dealer Hotline (800) 821-0806. In CA (800) 821-0807

TAXAN

TOTAL COMPATIBILITY FOR \$995

The New 710S Color Plotter and Taxan 440 Ultra High Res RGB Monitor. Now you can plot your exciting software diagrams on the dynamic and innovative new Model 710S Color Plotter. The New 710S is compatible with the HP7475A[®] Plotter. That means software programs like Autocad[®], Lotus 1-2-3[®], and many others are totally compatible! The new Taxan 710S Color Plotter offers a colorful six pen compatibility! Hardware compatible with IBM[®], COMPAQ[®], TI[®] and many other personal computers allows interface with functional software programs, and a complete compliment of business graphics when used with software programs like Lotus 1-2-3. The Taxan 710S Plotter for only \$995.00! Create those graphic masterpieces using the razor sharp resolution of the Taxan Model 440 Monitor. The Taxan 440 is the first Ultra High Resolution monitor to offer a 640x400 flicker free resolution.

**More power
to the
people that count...**

the all new Touchstone 2™

Entering numeric data into your PC is a very serious, very tedious business. Since a lot of this work is done by your fingers, doesn't it make sense to use a numeric keypad that was designed for the human hand?

Touchstone 2™ is a professional productivity tool for people who enter and revise numeric data...in spreadsheets, accounting systems, inventory control and similar applications.

Total one-hand control

The Touchstone 2 puts 53 key commands under the complete control of one hand. All of the most frequently used keys are accessible with a single touch, while a local shift key provides handy access to PgUp/PgDn, Tab Left/Right, ten standard F-keys, and other special control keys that you may need on an occasional basis.

Dedicated cursor and page controls

The cursor controls are always available right next to the number keys, and, at the touch of the local shift, they become page up and down, and tab left and right keys.

All your favorite keys in one place

Unshifted percent and brackets for speedy entry of compound math; space, backspace, home, end, alt,

ctrl, prt sc, and more, plus all ten standard function keys.

Even a place for your macros

To keep it compact, we couldn't include the whole alphabet, but Touchstone 2 does have A, B, and C to use as handy and easily-remembered hooks for user-defined keyboard macros.

Enter numbers twice as fast

Touchstone 2 data entry takes about 40% of the hand movement usually required with the standard PC keyboard. Even more important, it eliminates the need to look for each digit as it is entered.

Superior ergonomics

Low-profile design meets DIN specs; reduces fatigue. Number pad has slide-mounted Enter and math keys that conform to the traditional calculator layout. Heavy-duty case is easily lap-portable, but won't slide around. Standard locating pip on 5 key helps keep fingers where they belong.

Reliable performance

The Touchstone 2 has its own unique microprocessor with 16-character buffer and patented Entry Error Elimination system. Next-key rollover feature ensures positive entry of every keystroke, even when a previous key has not been fully released.

Full-travel keyswitches are rated for 50 million cycles; provide quiet yet positive feedback. Contacts are covered by a protective membrane to guard against dirt, dust and accidental spills.

Touchstone 2: Built so well it carries a full one-year warranty and a 15-day unconditional guarantee.

A plug-in workmate for the IBM PC and many compatibles

Split cable and standard connectors allow you to use the Touchstone 2 alone or side-by-side with the main keyboard of your IBM PC or XT and many compatibles. Additional models available soon will be compatible with the IBM PC-AT, PC JR., and Compaq.

An investment in greater efficiency

The all-new Touchstone 2 takes the tedium out of number-crunching; lets you concentrate on more challenging work. The time you'll save will quickly return your small investment of \$199.95. Order by mail or phone for immediate shipment, or ask for it at leading computer and software stores.

CIRCLE 299 ON READER SERVICE CARD

To order by mail: Specify PC model number and payment by C.O.D., Visa, MasterCard, or check enclosed. Credit card customers include complete card number and expiration date. Add \$3.00 for shipping (\$4.50 for Canada). New York state residents add 7% sales tax. Dealer inquiries welcome.

ARE YOU PLANNING TO UPGRADE YOUR PC AND DON'T KNOW HOW?

DON'T WORRY! CALL US ON OUR HOTLINE AND WE'LL SAVE YOU
THE HEADACHE AND HUNDREDS OF DOLLARS.

For years we have been selling our products through distributors hoping that they will provide better technical support and services to our customers. Lately, we find that most of them are not really technical and sensitive enough to satisfy our customer needs. In order to provide quality products and services at factory prices, we have decided to sell to you direct by passing distributors. Each of our product comes standard with an easy do-it-yourself installation guide. If you still have problems, our highly trained technical staff is only a phone call away to answer any of your questions.

To further back up our commitment for high quality and better services, our products offer a one year warranty and 30-day no question asked money back guarantee policy.

**10 MB Half-Height
Hard Disk Subsystem** *Too Low To Quote!* ~~\$599.00!~~

Save \$500 on our 10 MB Microscience hard disk drive which is normally listed at \$1,095. Microscience drives are the leader in the half-height hard disk industry and have been selected by many major computer manufacturers e.g. COMPAQ.

**20 MB Half-Height
Hard Disk Subsystem** ~~\$775.00!~~

Convert your PC into an AT. Save \$500 on our 20 MB Microscience hard disk drive which is normally listed at \$1,275. This drive is truly a breakthrough in technology. Its power requirement is actually lower than a 10 MB hard disk making it suitable to be installed into a PC.

10-45 MB 1/4" Streaming Tape ~~\$865.00!~~

No more worries in losing your valuable data. Save \$700 on this Wangtek streaming tape drive which is normally listed at \$1,595 and recently approved by IBM as their backup tape.

20 MB Streaming Tape ~~\$725.00!~~

Want to back up your valuable data and cannot afford the price? Consider this Memtec streaming tape drive which operates at the same speed as a quarter inch drive however at a much lower price. The limitation is capacity: 20 MB vs 45 MB. If you do not require high capacity back up, this is the ideal choice.

Please don't hesitate to call us for a free catalog and we will save you hundreds of dollars and headaches.

Why would anyone pay more!!!

In Canada Call (416) 549-2303

In California 800-JEDEN CA
If busy please call 714-545-6108

300/1200 Modem ~~\$225.00!~~

Want to dial into a bulletin board or NY Stock Exchange? Is price the only thing holding you back so far? Our modems are normally sold at \$425 through normal distribution. We think that is too much, therefore, we will sell to you direct for \$225. Our modem is 100% Hayes & Bell compatible with features like auto dial, auto log on and supports COM3 and COM4. With this card we also include a free communication software package.

Memory Expansion Card . ~~\$199.00 (with 64K)~~

Tired of running out of main memory? Why not expand your PC to the maximum memory of 64K and save \$50 to \$200. Can you imagine at a cost of \$199, we will ship you a memory expansion card capable of expanding 0-384K memory. We would even include a clock calendar with battery, parallel port, serial port, game adapter and 64K memory free. Furthermore, we will give you RAM Disk and Printer Spooler Utilities at absolutely no cost to you.

Half-Height Floppy Drive ~~\$119.00!~~

Add a half-height floppy to your PC, XT or AT or replace your full height monster with 2 of these half-height drives.

Color-Mono Graphics Display Card ... ~~\$280.00!~~

Are you frustrated to find out that your system can only run graphics either in color or mono? Frustrate no more. Try our graphics controller which offers 840 x 200 resolution in color and 720 x 350 in monochrome graphics. Install it in 5 minutes and save yourself hundreds of dollars.

MICROSOFT PRESS ■ PETER NORTON ■ THE IBM PC

AN UNBEATABLE COMBINATION

THE PETER NORTON PROGRAMMER'S GUIDE TO THE IBM PC

The ultimate reference
guide to the *entire*
family of IBM®
personal computers.

Finally... a comprehensive reference guide rich with resource information on the *entire* IBM family of personal computers: the PC, AT, XT, PCjr, and Portable PC.

The Peter Norton Programmer's Guide to the IBM PC is your ultimate guide to programming for the IBM PC environment. It's a gold mine of insights, techniques, technical data, and quick reference charts, all emphasizing the architectural similarities and differences among IBM's five personal computers. Whether you're an experienced or a novice programmer working in assembly language, Pascal, BASIC, or C, you'll find invaluable information for developing portable, effective professional applications.

By Peter Norton, recognized authority on IBM technology, creator of the acclaimed *Norton Utilities*, and noted architect of the now-famous philosophy of simple, clean programming.

\$19.95 Available now wherever books and software are sold.

You can buy a less expensive diskette and not save a thing.

One can understand the temptation to buy a less expensive diskette.

Rather than a Dysan® diskette.

After all, the less expensive diskette is probably almost as good. And should you run into a bad one, well, it didn't cost that much, anyway.

Right? Not quite.

You see, a less expensive diskette is by definition less diskette. And the few pennies you save are worth a great deal less than what you have to lose.

Namely, your data.

That's why it makes more sense to spend a bit more for a Dysan diskette.

Every Dysan diskette you buy will record and retain all your data all the time.

You can be sure of that because every Dysan diskette is certified 100 percent error free and backed by our lifetime warranty.*

So next time you're tempted to buy a less expensive diskette, ask yourself this question.

Can you really afford it?

For the name of the Dysan dealer nearest you, call toll free (800) 551-9000.

Dysan Corporation, 5201 Patrick Henry Drive, P.O. Box 58053, Santa Clara, CA 95050.

Dysan®

Somebody has to be better than everybody else.

CIRCLE 299 ON READER SERVICE CARD

What's Inside

A new executive editor, quirky writers, awards to unsung heroes, a special report on PC training, and persistent PR reps are the prime ingredients that went into the making of this issue of PC Magazine.

The more observant among our readers may have noticed that several designations on the PC masthead have changed. For those of you not familiar with editorial parlance, the masthead is the listing of staff members that appears on page 4. Authors live for bylines. Editors live for the masthead.

While admittedly it doesn't exactly make for thrilling reading, the masthead can be a rewarding source of information. New writers, for example, study masthead titles in order to guess who should receive their queries. Readers equipped to communicate electronically can find PC's database call numbers as well as the phone number for our Interactive Reader Service. Further, you can demonstrate your good eyesight to your friends by reading the entire bottom paragraph (in tiny 3-point type) out loud at arm's length.

Those of you who scan the masthead regularly may have noticed a new name on the Executive Editors line. If you look back a few issues, you will find that Barry Owen, formerly managing editor, has hopped up to join Paul Somerson as one of the exec eds.

Owen is one of PC's California immigrants. Although I am happy to report that he seems to have adjusted to New York, he retains a Californian's unnatural optimism. He now joins Somerson and editor Bill Machrone as a permanent member of the PC Editorial Planning Secretariat. While continuing to oversee the day-to-day production of PC, Owen will focus on "the middle of the book:" features and cover stories.

Of course, not all staff changes are reflected in the masthead. For example, executive editor Somerson is also enlarging his domain. To his current roles as editorial planner, chief editor for PC News and PC's many columns and departments, as well as the back-of-the-book technical columns, he adds responsibility for four special—we call them "blockbuster"—issues a year. A prolific writer himself, Somerson is now going to oversee the activities of all our "writing editors." These are the staff members who review products, run projects, and otherwise supply much of the copy that eventually finds its way into the magazine. Somerson will also supervise operation of the newly enlarged Lab, formerly referred to in these pages as "The Toy Shop."

Both Owen and Somerson will now

have the privilege of dealing with PC's contributing editors and freelance writers, most of whom are extremely knowledgeable, efficient, talented—and occasionally somewhat quirky.

For example, every magazine, and PC is no exception, has writers who are sure that every word dripping from their pens is worthy of a Pulitzer Prize. These writers call editors at 5:05 p.m. (just when they are halfway out the door with a tennis racket in hand or on the way to an aerobics class) and say, "Listen, do you have a few minutes? I just got the latest issue and read the changes you made in my article, and I want some things explained. To begin with, page 1, line 3, word 6. . . ."

And then there's the nervous author who is constantly updating material weeks after it's been submitted—important changes such as the name of the sister-in-law of the writer of the software. Or the writer who uses 16 paragraphs to explain how a new word processing program uses assembly language to perform one of its 100 functions and then doesn't understand why those long-winded paragraphs have to be cut from the story. Or the writer who calls at 4:45 p.m. on the day that the story is due and says, "I'm really sorry, but I just discovered that I accidentally erased my story, and I didn't have a backup. Do you mind if I'm about a week late?" Or the writer who. . . .

The Magnificent Seven

The seven men featured in this issue's cover package certainly do not need

someone like Owen or Somerson to spur them on to great heights of creativity. They are the industry's unsung heroes: those imaginative and intelligent individuals who have, either alone or with the

help of their peers, pushed the world of microcomputing into new and unexplored territory.

Associate editor Barbara Krasnoff, who interviewed these gentlemen, is

both a journalist and a native New Yorker (and, therefore, refuses to be impressed by anyone short of Albert Einstein). She was absolutely flabbergasted when she had finished the interviews. She reports that they are much more than just front-runners in their respective fields. "The thing is," she says, "they're all so damned nice!"

Too Complicated to Handle?

This issue also offers special reports on computer training. While more and more businesses are investing in computers for all sorts of applications, many are still running up against a sticky problem: what do you do with it once it's on your employees' desks?

Do you simply hand them the software and hope for the best, invest in an expert to show them what to do, or send them to an equally expensive seminar? Or is it possible, and more efficient, to set up your own in-house training program?

PC assigned some of its top writers to investigate all aspects of training. They not only run down all the factors that a business should consider when deciding how to train employees, but they profile several large and small businesses that have solved (or not solved) their PC training problems. *PC Magazine* also takes one specific and very popular software product—Lotus's 1-2-3—and reviews the full spectrum of currently available training resources.

An Unusual Complaint

Finding resources for the subject of training was no problem for the authors involved. Several of them contacted associate editor Lisa Kleinman with a very unusual complaint. "I've been getting calls from PR firms all day," one writer said. "The word's out that *PC* is doing a special report on training, and everybody wants to be in it."

Kleinman couldn't do much of anything for these unfortunates (especially since *PC* wanted to represent as many companies as possible) except suggest that they tell the manufacturers to call *PC* instead. You know where the phone number is, don't you? In the paragraph at the bottom of the masthead—the one with 3-point type. ■

MAKE ROOM FOR A NEW MASTER

New **DIAGRAM-MASTER™** helps you visually communicate complex processes and relationships such as, timeschedules, product flow, reporting structures, and much more.

Organize your organization.

Watch your organization grow right on the screen as you respond to **DIAGRAM-MASTER's** easy-to-follow prompts. Labels and boxes are sized automatically.

Make your point on time.

Display project schedules graphically, and give your audience "the big picture." Choose your time interval, name the activities, and insert up to three different types of bars for each activity.

Diagram-Master

Draw your own conclusions.

Our Drawing Board gives you all the graphics power you need to create unique business diagrams, or to customize your organization and Gantt charts. Create your own Library of shapes, or use ours.

DIAGRAM-MASTER joins forces with **CHART-MASTER®** and **SIGN-MASTER™**—the most widely used business graphics software family—to make quality presentations easy to create on any IBM or IBM-compatible personal computer.

Find out how. Call us at (203) 222-1974 for the name of your nearest dealer.

Dac Easy Accounting

\$49.95*

Special
Introductory Price
Ends July 31, 1985*

Dac Easy Gives You Seven Full Feature Accounting Modules In A Single Integrated Package.

Accounting software doesn't have to be expensive to be the best. Dac Easy gives you a fully integrated accounting system with instant access to General Ledger, Accounts Receivable, Accounts Payable, Inventory, Purchase Order, Billing and Forecasting. Imagine, you can generate over 300 reports from 80 different routines...all in a non copy-protected package. And, with Dac Easy you'll get a handsome slipcase binder with easy-to-follow documentation. Best of all, Dac Easy Accounting can be used to manage either service or product oriented businesses.

Find out for yourself why Dac Easy is the fastest selling accounting package on the market. Compare Dac Easy's features against other packages costing thousands more. Then, order your Dac Easy Accounting by calling our toll free number or returning the coupon below.

General Information

- Menu driven
- Password protection
- File capacity limited only by disk space
- Support contract available

General Ledger

- Unlimited # of accounts with multi-level accounting, unlimited departments
- 3 Year account history for CRT inquiry
- Period & per feature to correct mistakes without reverse entries
- Unique budgeting routine (see Forecasting)
- CRT transaction inquiry, unlimited journals
- Activity report, trial balance, financial statements, etc.

Accounts Receivable

- Open invoice or balance forward
- 3 Customized columns for aging report
- Unlimited # of customers
- Mailing labels and directories with 4 different sorts
- Automatic invoice charges
- Supports partial payments
- 3 Year customer history for # of invoices, sales, costs and profits
- Customized text on statements
- Cash flow analysis
- Sales analysis
- Automatic sales forecasting by customer, salesperson or customer type

Accounts Payable

- Check printing and up to 10 invoices paid per check
- Automatic allocation of available cash to payables
- Vendor directories with sorting by vendor code, name, or territory
- Aging reports with 7 customized columns
- Unlimited # of vendors
- Mailing labels with 4 different sorts
- 3 Year vendor history for CRT inquiry and printing
- Flexible payment calendar
- Automatic forecasting of purchases
- Unlimited allocations per invoice

Inventory

- Supports average, last purchase, and standard costing methods
- Powerful physical inventory routines
- Accepts any unit of measure like fractions, decims, gross, bags, minutes, etc.
- Automatics, changing of costing methods
- Time and product inventory
- 3 Year product history in units, dollars, cost, and profits
- Automatic forecast of product sales
- Automatic pricing assignments
- Alert and activity reports with 11 sorts
- CRT shows on hand on-order committed sales cost profit, turns, GMR

Purchase Order

- usable for inventory and non-inventory items
- Allows up to 20 lines per purchase order
- Per line discount in %
- Purchase order accepts gross, discounts freight taxes insurance
- Purchase Order accepts back orders & returns
- Purchase journal
- Automatic interfacing with General Ledger, Payables, and Inventory

Billing

- Invicing on plain or pre-printed forms
- Prints sales journal
- Automatic updating of committed products in inventory
- Ability to customize invoice for remarks
- Allows return credit memo
- Interfaces with Inventory, Accounts Receivable and General Ledger

Forecasting

Usage program that automatically forecasts using your 3 year history

- Forecast revenue and expense accounts
- Forecast vendor purchases
- Forecast customer sales, cost, and profit by customer or salesperson
- Forecast inventory item usage by 4 automatic methods
- Forecast by name as last year, or % base from last year, or trend, or least square trend line analysis method

Minimum Hardware Requirements:
IBM PCjr, PC, XT or AT or other compatibles, 128K memory, one 5 1/4" DDSD floppy disk, 132 column printer in compressed mode, MSDOS 2.0 or later.
*Trademarks of International Business Machines Corporation and Microsoft Corporation

NUMBER SMASHER

Speeds Up Everything...Especially 1-2-3™!

The MicroWay NUMBER SMASHER triples the speed of all cpu bound software while doubling the speed of 8087 bound software. When combined with MicroWay's FASTBREAK™ it results in an increase in the speed of 1-2-3™ of up to 80 to 111. If you're tired of WAITing, the SMASHER is the card for you!

The heart of the NUMBER SMASHER is a 9.54 mhz 8086 working with a matched high speed 8087. The card comes standard with 512K of 16 bit RAM and can be expanded to 640K. It triples the throughput of your original 8088 by doubling the system clock speed and quadrupling the data bus bandwidth.

Software compatibility is guaranteed by the nature of our card. It does not augment the 8088, but replaces it with a special 8086 that runs as a true 16-bit processor in the first 640K of ram and as an 8-bit processor everywhere else.

Examples of software which show dramatic speed-ups include AUTOCAD, 1-2-3™ worksheets which depend heavily on financial or transcendental functions, and multi-user operating systems. Any program written with an MS-DOS compiler that supports the 8087, such as MS-FORTRAN or 87BASIC, will run on the NUMBER SMASHER at least a factor of 2.5 times faster! Software that comes with the card also increases the throughput of I/O bound programs and includes a disk cache routine, ram disk and print spooler.

The NUMBER SMASHER is an upgrade product for 8088 based PCs and compatibles. It works on the IBM-PC and XT, the COMPAQ and compatibles manufactured to the IBM-PC hardware standard. Contact MicroWay or your local MicroWay Installation Center for technical specifications and supporting benchmarks.

**Micro
Way**

Recording Media
99.94% error free unfurnished
100% error free furnished.
Maximum dedication is
100% MB.

Up to 30% faster
than IBM's drive
Exceeds IBM specification
for AT high-performance
hard disk. Average Access
20 @ 30 MB 35ms
40, 56, 72 MB 38 ms

Boastable ROM supports
DOS and XENIX
Only from CORE

Rotary Voice Coil (RVC)
R/W head positioner
Fast and Accurate

Atplus™

Atplus drives are
manufactured
for CORE by
CURE
Full one year warranty
Service available worldwide
(drive shown with cover removed)

Automatic Park & Lock (AP&L)
Senses power interrupt, retracts
heads to safe landing zone. Heads
never land on data, virtually
eliminating risk of data loss.

Memory option.
15 - 128 Kbytes (150ms) D-RAM
chip set. Adds 256 KB to PC-AT
basic model making 512KB PC-AT.
With an Atplus drive, you can
build the PC-AT/IBM should have
built in the first place.

THE BALANCING ACT OF 1985.

You didn't buy an
IBM PC-AT just to
balance your checkbook.
You bought it to crunch
lots of numbers and
words, in the shortest
possible time. A labor
saver. A time saver.
Hence, a money saver.
So, do your part for effective
money management;
hard disk storage is no
place to be penny-wise and
pound foolish.

TELL 'EM YOU NEED HIGH SPEED, AND DATA PROTECTION.

These and other
important features do add
cost, but that makes a
premium drive.
Anything that can be
made, can be made
cheaper, sell for less, offer
lower performance, and
probably die young.

Remember, usually
you get what you pay for,
and you ALWAYS get
what you don't.

ALL HARD DISKS ARE NOT CREATED EQUAL.

There are vast differences
in the speed and reliability
of Winchester hard disks.
Since the IBM PC-AT is an
incredibly fast machine, a
slow drive can make an AT
run like an XT.

So, before you get stuck
with a slow drive in your
AT, save your boss two
grand and buy an XT.
Or better yet, buy the AT
and avoid any drive with
Access Times over 40 milli-
seconds.

RELIABILITY: WHERE HAS ALL THE DATA GONE?

Now tell 'em the drive
must have a data protection
scheme. One that's
easy to use and reliable.
Winchester heads read
and write while "flying" a
few microns above the
data surface. If the heads
contact the recording
media, you risk a head
crash, and significant or
total data loss.

So, even a fast drive
without data protection is
virtually worthless. Frankly,
we'd rather sleep at
night.

BEWARE OF USER-DEPENDENT PROTECTION SCHEMES.

Some drives have a
safe landing zone for the
heads, but you need to call
a separate program to send
em there. If you
don't call that program,
and most folks won't, the
heads in these drives
ALWAYS land on data
when powered down.

The slightest bump or
vibration can move the
heads, wiping out those
data tracks. And the R/W
heads can become
contaminated, thus
increasing the error rate,
slowing down average
access until the whole drive
fails.

Consequently, those
drives offer a very high
risk of head crashes, a
false sense of security, and
little else.

What's your data
worth? \$300? \$400?
Specify AUTOMATIC
data protection. Atplus
has it. And it doesn't cost,
it pays.

PEACE OF MIND.

Specify AUTOMATIC
park and lock of the heads
on power down.

This system provides
unparalleled head crash
protection, by sensing
power loss to the drive,
and retracting the heads
to a dedicated landing
zone before they can land
on your data.

Since this is 100%
automatic, user-dependent
risk is eliminated.

OUR DRIVES HAVE ALL BEEN TO BOOT CAMP.

Avoid drives that
CLAIM PC-AT compatibility
but can't BOOT the AT.
By the time you juggle the

disks necessary to use
one of those drives, the
phrase "user-hostile" will
have deep personal significance.

We believe that
computers ought to serve
people, not the other way
around.

BEWARE OF THE BARGAIN BAND-SCHLEPPER.

Avoid drives with in-
expensive Band-Stepper
positioner technology.
These were pretty good
way back in 1980, con-
sidering that's all anyone
had. But by today's stand-
ards, they're inaccurate
and very mechanical.

They waste time look-
ing for the right track to
read or write. And they're
worth no where near the
price you'll pay for 'em - in
more ways than one.

THE HIGH TECH SOLUTION.

Specify state-of-the-art
ROTARY VOICE COIL
(RVC) head positioner and
CLOSED LOOP SERVO
technologies.

This system uses a
DEDICATED SERVO
SURFACE (DSS) for
continuous head location
information.

The RVC and DSS
use a large scale micropro-
cessor to translate new
track-seek commands into
current that is applied di-
rectly to the RVC.

This moves and holds
the R/W heads at the
exact track intended.

Speed is dramatically
increased since head
movement is created elec-
tronically, with minimal
mechanical interfacing.

BEHOLD THE SOLE SOLUTION.

Specify names you
know and can trust. Like
Control Data Corporation,
a world leader in hard
disk technology. And
CORE INTERNATIONAL,
a growth company with
over ten years in computer
technology, design and
manufacturing.

ATPLUS: IDEAL FOR THE SPEC MANIAC.

Atplus High
Performance Hard Disk
Upgrade kits, available in
20, 30, 40, 56, and 72 MB
capacities.

They have ALL the
above features and none
of the shortcomings of
"bargain" drives.

And your AT will
accept any two Atplus
drives, for up to 144MB of
bootable, reliable, DOS
and XENIX supporting
high-performance on-line
storage, all inside the box.

TELL YOUR DEALER...

That only Atplus Hard
Disk Upgrade Kits from
CORE will do.

If he or she doesn't have
em, we'll gladly send them
up as Atplus authorized
dealers.

CORE INTERNATIONAL

542 S.E. 5th Avenue • Delray Beach, Florida • 305/276-3929

IF YOU PROGRAM IN 'C', PC BRAND

Our Craftsman™ Line Has New Products,

C-SPRITE

Lattice's Own Symbolic Debugger for Lattice® C

This versatile companion to your compiler gives you the best of both worlds for an out of this world price. Hand it a COM or EXE file produced by the Lattice compiler (using the -d option) and C-Sprite™ will speak your language: your function names, variable names, array data types, and the line numbers from your source code. At the same time you can get a close-up view of machine addresses and machine-coded instructions, if you want to scrutinize just what macrotricks the compiler (or an assembler) contrived.

You already know how to converse with C-Sprite if you are familiar with Microsoft's Debug. Lattice begins with that well-known command language, and added to it considerably. You can work with data in hex, as you might expect, but you can also differentiate between C's data types to cause the debugger to treat addresses as strings, long integers, etc., even pointers, both in display and entry.

C-Sprite can set breakpoints using symbols or addresses. You can inhibit characters of code to be executed at the breakpoints, or set commands that execute until a condition is met.

C-Sprite even has macros—use your source code variable names in a macro to dump the contents of entry C structures, for example. And you can debug through one of the COM ports with a second terminal so as not to disturb your program's display screen. What's more, if you link with Flink26™, C-Sprite can even take overlays.

Program doctors will find plenty of implements to rummage through in this kitbag.

dBC

Switch from dBASE's Language to C for Power, Speed

There are a lot of dBASE™ file users out there. Most of them just keep data bases and use dBASE's limited reporting facilities. They're not programmers, so they don't use the dBASE programming language. But they'd like more for their efforts, and that's a business opportunity.

dBC™ links to dBASE. It is a function library that creates files which effectively replicate dBASE file design. So dBASE can read and update them. And the reverse: dBC can use any files created by dBASE. Now C and dBASE can operate on the same data bases interchangeably.

That opens up the widespread culture of dBASE installations to exploration by C programmers. Now you can replace the resident

TEXT TOOLBOX™ #1

These Utilities Work Wonders of Organization

Welcome to "grep", "wc", "ed" and "diff". You tools you will reach for as routinely as "copy" once you come to know them. Unix™ boasts a number of marvelous utilities that are missing to the PC world. Lattice has assembled a cluster of the most useful text management tools into a simple package.

"Grep" looks for text patterns in any number of files. Want all occurrences of a global variable throughout a program system? Want to search all programs in a directory, down paths to other directories, or all files on a disk? Need to find all the function calls in an entire program system? Grep can do it with a powerful expression syntax that goes far beyond your text editor's search command, because you can tell it to search all "c" files for all lines with "f" and "f", no matter how many characters between the parentheses. Its text searches will match any character in whatever character range you cite, in a single character position or anywhere in a string, as you specify. Or "Grep" will match patterns only at the beginnings or endings of lines, and can differentiate between embedded and isolated strings. "Grep" is a real gem.

"WC" counts lines, words, and characters in a file and has a checksum independent of machine character sets so you can test whether a file has successfully been transferred between computers.

"Ed" is similar to the well-known Unix editor. It offers search and replace with "Grep's" syntax, block move, read and write, optional line numbering, append, insert, delete, and thus unusual facility: you can instruct "Ed" to apply a file of commands to any number of target files, even copy-created changes and test additions, such as those created by "Diff".

"Diff" You've probably tried to write one (and then discovered how tangled the logic gets). "Diff" compares text files line for line and reports differences. It's much more sophisticated than "Bliscor", if your MS-DOS has that. It can optionally ignore "white space" differences (blanks, tabs), use complex algorithms to re-synchronize between files after disparities of any number of lines are found. And its output is a precise list of instructions telling what to do to make two files the same, a list which you can hand to "Ed" to do the job.

Text management with the speed of C. And you no longer have to write every line of code, because moving from C imitates C's vast storehouses of shell functions and utilities.

Use dBC for custom work for customers, or design generalized programs for manipulation and reporting of dBASE data bases. Or use it on its own. It's a complete ISAM file manager for use with the Lattice C compiler whether or not dBASE is ever used in tandem, but versions for all four memory models, and can handle index and data files open at once. dBC is a complete set of ISAM routines (that parallel dBASE commands) which the manual and demonstration source files on the disk explain in detail.

Two Versions:	Product Code:	Lot Price:	Our Price:
Dbase II Compatible:	L201	\$250	\$225
Dbase III Compatible:	L202	\$250	\$225
Both:	L203	\$500	\$375

You'll ultimately find such assistance indispensable. Lattice having a library to sort out the confusion every day and keep your work tidy.

Product Code:	Lot Price:	Our Price:
L200	\$120	\$105

CURSES

A Screen Management Interface to Swear By

Curses is a Lattice creation which manages the screen of the IBM PC in the same fashion as the classic utility of Unix and similar operating systems. Use it to adapt programs which call Unix's curses functions for screen management, and need the equivalent library when moved to the PC for re-compilation. Or use it when creating software on the PC to assure that it is Unix compatible.

Curses is a library of eighty-four functions and macros which can keep any number of screen images in memory. A screen may be full or partial size, and any can be summoned to the physical screen at your program's command.

Within a screen, Curses employs a vast function set to get characters, wrap lines, scroll, blank lines, highlight—virtually any tool needed to update the screen. The product supports color, and all four memory models. Its input functions give you control over whether to echo each character to a memory screen. In keeping with the terminal orientation of Unix curses, the physical screen is re-painted (at high speed) only when your program calls a refresh function.

Writing screen management code leads to unspeakable marks and expressions. Swear off! Let Curses clean up your language.

Product Code:	Lot Price:	Our Price:
L080	\$125	\$110

C CROSS COMPILERS

Portability to 16-Bit With Cross Compilers From Lattice

PC BRAND now carries an assortment of cross compilers to move programs from larger host machines to the PC-DOS or MS-DOS environment.

Cross compilers are now available for these hosts: VAX/VMS™, VAX/UNIX, MC68000/UNIX, Alpha 386, Hewlett Packard-UX.

Cash in on products already developed on your bigger machines by rapid transfer to the burgeoning world of PC users. Or take advantage of big machine services and utilities for your development work for the PC market, and only then download the results. A quick mental calculation will convince you that productivity gain will quickly trade off costs.

Expand Your Sales to the CPM World

They have vanished from the headlines, but there are over a million CPM™ machines still humming across the land. Yet *InfoWorld* reports that "there's no new CPM software." If you are part of the problem, here's a money-making way to become part of the solution. Convert your MS-DOS/PC-DOS products with our CPM-280 targeted cross compiler. For a few dollars, you'll double your market in a hurry.

CODE SIFTER

Find the Fast Track for Your Program

You know it runs, but how fast? If it can't win, better not enter it in today's horse race. Don't let it out of the stable until you've put it through its paces with this perfectly priced stopwatch.

Code Sifter finds the sluggish spots in your program. On its own, it will divide a COM or EXE file of any size into thirty-two equal portions. Alternatively, you can specify the portion boundaries with addresses, or with symbols if your linker has produced a symbol map. Then tell Sifter to test a program. It samples your object file at precisely timed intervals and counts how many times it finds the instruction pointer in each portion, job done, it reports the number and percentage of hits in each portion.

You can find some surprises when you discover just how unbalanced the activity is likely to be, and that's why Code Sifter is so valuable. It profiles just where you can best spend time optimizing your code, or even converting to assembler subroutines.

Code Sifter has a number of interesting options. You can tell it to include any combination of your program, DOS, and BIOS in its analysis. You can specify the sampling rate. You can tell Code Sifter the number of times to run a program, and between each run discard less active ranges, and re-position the hot spots, so the next scan is even tighter on small areas of code. Right down to the last byte! Try it on the sample program that comes with your disk.

Code Sifter: It will give you the racer's edge.

Product Code:	Lot Price:	Our Price:
N100	\$118	\$99

CVUE

A Text Editor to Make Your Own

CVUE is a host-centric oriented text editor which does most of the things that a good editor should do, such as automatic scrolling vertically and horizontally, insertion and overwrite entry modes, block delete, update and move, and full DOS 2.0 directory path name support in reading and writing files.

It is easy to learn with a comprehensive documentation menu screen which makes the documentation an ornament. It was written by the Lattice programmers who felt forgotten by the folks who write WP software. They needed easy entry of non-display characters such as control codes and escape sequences, not footnotes. Indenting and unindenting of block structures learned longer than italic printing for them. Pattern searching was over spell checking, so CVUE was born.

CVUE has its limitation. It only supports memory-resident files, but with memory at today's prices, creating and maintaining files 800 Kbytes long is practical. Anyway, modular source code of structured programs never gets nearly that big. As compensation, CVUE is very compact and fast. Even in 80K computers it has no need for tediously slow overlays to perform its full function repertoire.

The power of CVUE is in ease of customization. The private version offers full customization of the keyboard editing commands. And when you take advantage of the Source Code option on the next page, the resultant editor can be made truly your own.

INTELSPEAKS YOUR LANGUAGE

Reduced Prices & Plenty of Source Code

C-TREE

B-Tree File Manager, Source Code, No Royalties! **NEW!**

A b-tree can be infected with bugs, so before trying one, ask its age. In a word of legends, this one is a real antique. C-tree™ has been around since 1979. That means reason, sturdy code which hasn't crinkled under the weight of prolonged and widespread use.

LMK

A Unix-like "Make" Makes Light of System Building in Any Language

If you have ever built a complex system, you know the time loss and tedium of recompiling, rebuilding libraries and relinking modules because a snippet or two of code has changed. Batch files are no answer. You need batches of code to avoid redoing everything indiscriminately.

Instead, imagine making a change deep in a system, and simply telling Lattice's LMK™ to take over. No further thinking or hazy dreams. LMK will rebuild your final product, however involved and complex, by doing just what is needed and no more.

How? You write a command file which expresses, bottom to top, all the elements comprising your system and all its dependencies: what gets compiled to make what object file using what options; what is built into libraries; what is to be linked into the final EXE file. Through the life of your system LMK keeps track of the last time every action was performed. Run LMK and, tracking each branch, it looks only for elements which changed later than a dependent element further along the branch, using date and time information in the file directory. Any source file newer than its object file, for example. Only those elements and their dependents are re-made. All other features are bypassed.

The command file uses a simple, readable syntax—`<prog.obj> prog $(HDRVS)`, for example, says what source file this object file depends on, and says to fill your previously-defined macros HDRVS into the expression, which in this case might be a list of files with hardware drivers, or in another case your preferred string of compiler options.

LMK does not care what programming language you use, it's not just for C. For that matter, LMK can apply to more than programming. It can be used for any set of tasks which can be accomplished through commands issued to the operating system. Try it for repeated reassembly of lengthy documentation, or for selective reinstallation of spreadsheets so that only the dependents of altered supporting modules get re-calculated.

Whenever your imagination leads you, LMK will find the shortest path to get the job done. Minimum time, maximum effort and job ease.

Product Code:	L1200	1985	Our Price:	\$175
---------------	-------	------	------------	-------

If developer has added two very unusual features. C-tree now comes in C source code, revealing all you've ever wanted to know about how b-trees are written. Second, provided you bind it into your binary application, you can re-designate C-tree without royalties.

Thanks to source code which does not deviate from the K&R standard, C-tree can travel. LMK has always meant finding a substitute file manager when you port your work to another computer, operating system, or computer, then changing all the function calls and linking away. That's one. Two: In many environments prove that C-tree gives your application a ticket to anywhere.

C-tree permits any number of keys for a data file, supports duplicate keys, alphabetic, numeric, or even: it's a big product with everything you could expect. Beyond that it is intelligently designed so with a high level set of SAM routines to minimize your coding by handling all details of adding a record on its own, for example, and as low level operations which you can access directly. Either way C-tree maintains optimal index structure which will find a record among a million ten byte keys in no more than five disk seeks.

And if all this is disappointing, now the good part. C-tree's design splits nodes to allow any number of users to access an index file simultaneously even when updates are in progress so that multi-user configurations and adaptation to networks are possible. You must write the record-logging routines, as they are compiler and operating system dependent, but the documentation shows how by example.

Product Code:	L1001	Our Price:	\$345
1985			

USED COMPILERS WELCOME

Trade In for the Latest Model Lattice C

Has your compiler run out of gas? Has your model been discontinued? It is falling behind for lack of new parts?

Even if yours is in good shape, you have surely noticed there are more options and accessories produced to run with the Lattice C compiler than any other. Don't do without these accessories any longer. It is time for new items please. Trade in your original data and manual of any of the up-to-date models and we'll send you Lattice's most up-to-date model, the full bore 2.15 (at press time).

From them on you will be adopted by Lattice for full, direct support by their technical staff.

Microsoft MS-DOS/PC-DOS C	Price:	\$150

PRE-C

Thorough "Lint"-like Analysis Now on the PC **NEW!**

Users often have long asked if we had a "lint" to give programs a thorough cleaning before they disappear into a compiler. The answer now is "yes".

Pre-C™ finds problems your compiler won't. Problems that a debugger will have trouble

finding out. Even problems which will cause trouble with other compilers.

Pre-C finds all the syntactical tripe that will blow out a compiler, sure, but it goes after subtler problems: code which will never be executed, casts with suspect conversions, variables declared as external but never used, functions never called, obsolete usage (even the C language has changed), machine-dependent expressions which will inhibit portability.

Compilers work with one module at a time. They know nothing of other modules which only meet up at link time. Pre-C can look at all segments of your program at once and report to you any inconsistencies of inter-module references: conflicting data type declarations, parameter lists in function calls which disagree with the functions themselves in number or data type, declarations of external functions which differ from their definition.

Pre-C uses the Unix System III compiler standard to safeguard maximum portability anywhere in the C world. There are then plentiful command line options to advise Pre-C what to flag and what to forgive, useful during early coding when some functions are empty or incomplete. The resulting analysis can be filed for use with subsequent Pre-C runs, so work is not performed redundantly.

Pre-C lets you develop standing profiles of binary libraries you have purchased. In any C program you subsequently write, Pre-C can use these profiles to make sure your calls to those libraries' functions are perfect.

This is a big product which will work nicely in speeding large system development.

Product Code:	L1008	1985	Our Price:	\$329
---------------	-------	------	------------	-------

Normally file in LMK but requires UNIX to analyze large programs. Requires disk space about 20% the size of all files to be analyzed.

SUPPORT DIRECT FROM LATTICE

Products with codes beginning "L" are all fresh from Lattice Inc., the premier software developer serving the C professional marketplace. PC BRAND has made special arrangements for Lattice to provide telephone support for these products directly. Take advantage of this unusual opportunity. Buy from PC BRAND, and you get to talk to the experts themselves!

30-DAY MONEY-BACK GUARANTEE*

It gets better. We will return the purchase price of any "L" or "N" coded product offered in this space if you decide it fails to meet your needs. We want you to be completely satisfied with your purchase. Go through the manuals, try out the products themselves, and make a thoroughly informed decision whether they are right for you.

This is a risk. We can make this offer in the U.S. and Canada. To be eligible for refund or credit, we must receive your returned product within 30 days of its shipment, and it must in our judgment be in 100% resalable condition.

(a) Subject to terms and conditions of sale.
(b) Not shipping and handling.

SOURCE CODE FOR SALE

Designer Originals For Your Special Needs

One size fits all means always disappointed customers. When you cannot shoehorn your application into out-of-the-box software, we have the solution. For each of these products only PC brand now licenses source code, provided you buy (or have already bought) from us the object code counterpart. Take it in, let it out, and make it fit your needs snugly. And, if you are new to C, you will learn a lot appreciating this fully documented code from top designers.

TERMS AND CONDITIONS OF SALE

Licenses: Each price is for a license to use a product on a single computer and does not constitute its ownership. Ask about availability of other terms for multiple machine use at a single site. Products may be used to create programs for distribution without royalty payments or additional concerns, provided said programs do not substantially replicate the products themselves.

Compatibility: PC BRAND's standard products are designed to operate with the IBM PC, PCXT or AT under PC-DOS and require no more than 128K of RAM unless indicated. For non-IBM machines using MS-DOS, determine compatibility from manufacturer.

Returns: Defective parts will be replaced. For products not coded "N" or "L": Acceptance for

refund or credit only by prior authorization subject to re-stocking charges. Delistings in issued orders irrevocable once sent a broken disk.

Payment: We honor MasterCard & Visa (no surcharge), wired funds, checks in advance, and COD for cash, money order or certified check (no COD charge). Purchase orders accepted from larger corporations and institutions at our discretion; terms: net 30, each addt \$3. UPS 2nd Day Air: first product \$10, each addt \$4.50. UPS Next Day Air or Federal Express: 1st product \$15, each addt \$5. International: Charges depend on destination and shipping method.

MICROWAY'S 8087 RUNS 1-2-3™!

MicroWay is the world's leading retailer of 8087s and high performance PC upgrades. We stock a complete selection of 8087s that run at 5 and 8mhz. All of our coprocessors are shipped with a diagnostic disk and the best warranty in the business - 180 days! We also offer daughterboards for socketless computers such as the NEC PC and PCjr, and a board which increases the clock speed of the 80287 in the PC AT. Our new NUMBER SMASHER™ includes 512K ram. It will run the IBM PC at clock speeds up to 9.5mhz and achieves a throughput of .1 megaflops

with 87BASIC/INLINE, Intel Fortran, or Microsoft Fortran. Software reviewers consistently cite MicroWay software as the best in the industry! Our customers frequently write to thank us for recommending the correct software and hardware to meet their specific needs. They also thank us for our same day shipping! In addition to our own products which support the 8087 and 80287, we stock the largest supply of specialized software available anywhere. For information call us at

617-746-7341

FASTBREAK™

MicroWay's daughterboard turns on your 8087 during 1-2-3™ execution and extends DOS functionality. Recalculations run up to 36 times faster. Includes an 8087 chip. When used with the NUMBER SMASHER™ it can provide a total increase in 1-2-3™ execution speed of up to 79 to 1.

CONFIGURATIONS:

FASTBREAK™ 5mhz.....	\$339

DECLARE YOUR DATA INDEPENDENCE.

THE NEW STANDARD OF MODERN OFFICE DATA STORAGE.

Free yourself from the limitations of shared and finite hard disk storage. Your dynamic and expanding business data needs demand a more versatile way to deal with critical information.

The Bernoulli Box,[™] with its totally interchangeable 10-megabyte cartridges, lets you manage data the way you manage your business—directly, efficiently, by job function

and application. You create, update, store, and back up software and data bases on individual cartridges. You expand your capacity infinitely by adding more cartridges, not more disk drives. You enjoy the convenience of taking or mailing cartridges anywhere—and the security of putting them under lock and key.

The Bernoulli Box works with the IBM PC, XT, AT, and most compatibles. For your nearest dealer, call 1-800-556-1234

THE ADVENTURE CONTINUES . . .

HOMEBASE

\$49⁹⁵

SOMETHING BRAND NEW

INSTANT DATABASES . . . BECAUSE THAT'S HOW MOST OF US NEED INFORMATION . . . INSTANTLY!

Homebase provides you instant access to a whole realm of databases. Just hit the hotkey to freeze whatever software you're working in, and you're ready to find, insert or manipulate data.

This is much more than a simple cardfile or mini-database. You'll be able to set up your own templates, define parameters such as the length of a field, and do rapid key searches. You can have thousands of records in a database. And numerous databases on your menu.

THE TOOLS YOU NEED.

We've included a powerful set of tools that will save you time and help you organize information, schedule, calculate and a whole lot more. All within a quick keystroke—regardless of the software you're running! You may find a few of these in some "desktop" products—but nothing else approaches the power of Homebase!

- | | |
|---|--|
| <ul style="list-style-type: none">• Instant Databases• Phone Message Pad• Rolodex™• Appointment Calendar• Calculator• Rolapod• Time and Expense Diary• Programmable Hotkey (You choose the key that gets you to your Homebase)• Electronic Mail (as an automatic multi-task)• Tables and Pages (for those things you always need to look up)• Alarm Clock (including Musical Snooze Alarm)• To-Do List | <ul style="list-style-type: none">• Quickterm Terminal (available even when you're working in another program)• Autodialer• Template Maker (for designing your own databases)• DOS Services• Rolodex Card Printer• Data Transfer (between databases or your other software)• Cut and Paste (great for putting together an Electronic Mail letter that combines a chunk of spreadsheet, some text from a document, and a few notes) |
|---|--|

THE EXCITEMENT IS BACK

With the Electronic Mailbag of Your Dreams

ELECTRONIC MAIL THAT TAKES CARE OF ITSELF . . . IN THE BACKGROUND

(While you're running WordStar, Lotus, dBase, a compiler or whatever)

We wanted electronic mail that could take care of itself while we were busy on the computer doing something else.

We always felt that there was something strange about having to play postman every time a piece of electronic mail was due.

It was always a case of loading up a communications package and either waiting for the mail or going out to fetch it.

Now, we've got it! And you can have it, too. With HOMEBASE, Electronic mail can arrive while you're working in another piece of software. Up in the corner of your screen, a signal lets you know that there's incoming mail. You can read it as it comes in, if you want. Or you can ignore it, and your mail will automatically file itself . . . to be read at your leisure.

When you're sending Electronic Mail, it's just as easy. Once you've written and addressed your letter, the rest is done for you, automatically, while you're back working in another piece of software.

CHECK THE DIFFERENCE IN VALUE!

WHY ARE YOU GETTING SO MUCH SOFTWARE FOR SUCH A SMALL PRICE?

Amber Systems makes tools for programmers including VSI-The Window Machine. We make mouse drivers, asynchronous drivers and electronic mail packages for a number of companies. Now, we've decided to use these tools, plus some new ones that aren't yet on the market, to produce new concepts in software. Because we make the tools ourselves, our costs, and consequently yours, are the lowest possible . . . with never a compromise in quality.

YES! Site licenses are available for companies . . . large and small. If you would like to order a single copy, now, to examine and show around your company, its cost can be deducted, later on, from your site license.

For further information on site licenses call 408-996-1883.

Support	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input checked="" type="checkbox"/>

A perfect report card. It wasn't necessarily our goal when we added the most recent enhancements to WordPerfect. We were more interested in responding to the suggestions of our users and dealers.

But a perfect report card is like icing on the cake. And it makes us more confident than ever that WordPerfect 4.0 is the most perfect WordPerfect, yet.

Easier.

Most WordPerfect 4.0 functions require only one keystroke, a simple press of a finger. And new comprehensive documentation makes learning a breeze.

Faster.

Document orientation means WordPerfect 4.0 never makes you

wait between pages. No matter how fast you type, WordPerfect won't slow you down.

Better.

WordPerfect 4.0 includes several features not found on many word processors. Like a 100,000-word phonetic dictionary; multi-page footnoting capability; table of contents and index generation; automatic outlining and paragraph numbering; and a 4.0 network version.

Get the word processor that lives up to its name (and its report card): WordPerfect 4.0. For more

information, see your dealer. Or call or write

new version lives up to its perfect billing

Compaq's 286: A Fast PC AT Clone

AT compatibility is a key selling point of the 286 line.

FIRST LOOK

BY BILL MACHRONE

The Compaq 286 is more than a PC AT clone. It's faster.

It's better, too. You can buy it right off the shelf with up to 70 megabytes and Compaq's proven tape backup system.

I tested two versions, the Portable 286 and the Deskpro 286. Both come with 512K on the motherboard, both are available with tape backup, and both have the AT-compatible 1.2-MB floppy drive. They share Compaq's famous dual-mode green screen and faithfully follow the PC AT's dictates by including a security lock.

The original Deskpro sported an 8086 and ran just a tick slower than a PC AT. It also had a compatibility switch that ran the machine at standard PC speeds in case you had some brain-damaged software that malfunctioned at the higher rate. The

new 286 machines run significantly faster than the PC AT because they are clocked at 8 MHz instead of 6 MHz. Given Com-

paq's slavish desire for unimpeachable compatibility, you won't be surprised to learn that the new 286s include a 6-MHz mode as well.

One place where the desire for compatibility helps enormously is the keyboard. The original Deskpro retained the old PC layout. The 286 machines, however, use the AT's more typewriter-like layout and follow IBM's scheme right down to the misplaced Escape key. The keyboards feel like the Deskpro's: superior to the original Compaq Portable but still not up to IBM's definitive over-center click. You can still change the key-click volume and flip from monochrome emulation to medium-resolution color emulation with Alt-key combinations from the keyboard. You can also change be-

(continued on next page)

VisiCalc Production Ends

BY JAMES LANGDELL

CAMBRIDGE, Mass.—*VisiCalc*, the granddaddy of spreadsheets, is dead at the age of six.

Lotus Development Corp. says it will no longer produce the pioneer spreadsheet *VisiCalc*, one of the assets acquired in Lotus's takeover of Software Arts earlier this year.

"We feel 1-2-3 and *Symphony* are much better products, so *VisiCalc* is no longer necessary," says a Lotus spokesperson. Lotus says it will provide users of the spreadsheet with support for the next 2 years. During that time, replacement copies of the copy-protected program

will remain available. Customers with IBM-compatible versions of *VisiCalc* can trade in that program for a copy of Lotus's 1-2-3. Upgrade kits can be purchased for \$250 from dealers only from August 1 through October 31. Lotus is making no upgrade offer to *VisiCalc* users with non-IBM versions.

Only authorized Lotus dealers can exchange *VisiCalc* packages for credit toward Lotus products.

VisiCalc was created in 1979 by Dan Bricklin and Robert Frankston, founders of Software Arts. VisiCorp marketed the program under an exclusive agreement until 1984, when lawsuits between the two com-

panies were resolved and Software Arts began selling *VisiCalc* under its own name.

About 1 million copies of the spreadsheet were sold during its product lifetime, including 300,000 IBM-compatible versions, according to informal estimates supplied by Lotus.

In addition, Lotus announced its plans for some other programs acquired from Software Arts. *Spotlight* will be offered as a Lotus package, but the company is trying to arrange for another company to manufacture and market *TK/Solver*. Lotus said it also acquired rights to unnamed software that Software Arts had been developing at the time of the takeover. ■

Compaq's 286

(continued from preceding page)

tween 6- and 8-MHz operation.

The Portable 286 has the 10-MB Rodime drive found in the Compaq Plus, while the Deskpro 286 comes equipped with a 20-MB drive. The Rodime, with its inherent ruggedness and Compaq's shock mounting, can stand up to the worst that users can dish out to the Portable. The 20-MB drive has a new twist for MS-DOS computers, a shipping lock. The machine arrives with the power connector detached,

SPEED OF THE READ

CORE Disk Access Test*

Compaq Portable 286	68 milliseconds
Compaq Deskpro 286	36 milliseconds
IBM PC AT	39 milliseconds

*Measures average random disk-access speeds.

so you can't use the hard drive until you've removed a pin and moved a lever. Then you plug in the power connector and you're ready to go.

The new Deskpro's 20-MB drive is made by CDC's MPI division, and it is faster than the Portable's smaller drive, which

is more in line with that of the PC-XT. It turns out that the Deskpro 286's drive is actually a bit faster than the PC AT's (see "Speed of the Read").

The new 286 machines perform pretty much as you would expect: like a Compaq, only faster. In our BASIC bench-

marks both machines were faster than PC AT's running at equivalent speeds. Compaq is one of the few compatible manufacturers to have gotten the source code to BASIC and improved it, so most programs run a bit faster.

The type of fan and its location on the 286 Portable are different from its Compaq Plus predecessor. It is much quieter—a welcome improvement. The machine weighs marginally more than the previous model, but once your shoulder is dislocated, what's another pound or two? ■

COMPAQ-AT TIME TRIALS

*Tasks performed with programs written in BASIC.

Software Sellers
Line up Their Sites

New licensing policies are proliferating in an effort to get a bead on a solution to software protection problems.

BY CHARLES BERMANT

NEW YORK—The squeeze is on. Software developers have launched a war on unauthorized duplication of their programs; yet too often their victories have been Pyrrhic. Software remains protected, but at the high cost of customer dissatisfaction with program quirks and limitations.

A synthesis is emerging from this conflict of suppliers' needs and customers' demands: site licensing. As a solution to the problems of software protection, it looms as the next trend in the marketing of products for personal computers.

All site licensing has one theory in common: A vendor authorizes the duplication of a program for use in a defined physical area of one company or institution. Beyond that, there

are as many approaches to site licensing as there are companies offering the arrangements. The site license authorization can be as narrow as granting permission for a program to be shared on a local area network or as wide ranging as an all-you-can-eat buffet, giving a customer as many copies of a program as he wants for one price.

Sorcim/IUS of San Jose, Calif. is the latest to unveil a site licensing program. Sorcim is marketing its productivity, business, and accounting packages at a 40 to 70 percent discount. Each diskette can be copied in quantity according to the site licensing contract. Manuals are also supplied in quantity.

The Sorcim program began in mid-June. Paperback Software, the Berkeley-based company headed by Adam Osborne; Satellite Software International of Orem, Utah; Living Videotext of Mountain View, Calif.; and MultiMate International of Hartford, Conn. are among those who have announced their own versions of site licensing agreements. Summa Technologies of Beaverton, Ore. took the lead early and has site licensed four programs for some months now, signing up some major universities, the Los Angeles County government, and a

division of Shell Oil.

"I don't try to win my competitors over to the concept of site licensing," says Summa president and CEO Ken Scott. "I'd like all other publishers to maintain their single-use licenses, adopt the ADAPSO standard, sue individual clients, and continue retail sales. Then I'll clean their clocks."

Fitting dealers into the site licensing equation has been a major stumbling block. Sorcim's vice president of marketing, Michael Crosno, says that his company's program is the first to benefit both dealers and corporations. Under the Sorcim plan, licensed dealers receive a commission whether or not they're involved in the sale.

"After a sale a certified dealer can get a check for 10 or 12 percent for doing nothing, as a gift," says Crosno.

Summa, on the other hand, is seeking to bypass dealer channels completely.

"Site licensing puts dealers

controversy generated by software use on local area networks, adding that programs that don't have to recoup the costs of merchandising will ultimately cost less.

Dealers Beware

Limited shelf space, along with dealer unwillingness to stock untied products, has made it difficult for small software vendors to sell their wares. Summa has been unsuccessful in building a successful dealer network, which makes the company resentful of both retail profit margins and what they perceive as a closed-minded attitude.

Dealers, not surprisingly, have reacted more positively to the Sorcim proposal, which does not cut them out completely.

"This reflects a greed typically exercised by smaller companies who are going to lose a share of the dealers anyway," says John Williams of the Software Specialists in Washington.

"Site licensing puts dealers back where they should be, in the position of dealing with hardware where there are better margins."

back where they should be, in the position of dealing with hardware where there are better margins," says Scott. "Retail serves a good purpose, that of a low-volume customer who has prior knowledge of what he wants. If distributors and retailers turn against me, then I'll deal with customers directly."

"A dealer can turn against a software publisher. Vendors don't now know how to work the dealer in; if they were to start over, they'd do it this way."

Take My Program, Please

The Summa agreement licenses each site or division of a corporation, permitting any current or future employee to use the program legally. Under the agreement, employees can also use the software at home without threat of litigation. Scott says the program eliminates the

"I lose confidence and enthusiasm for any company that shows a tendency to screw the dealer."

Williams, who called the Sorcim program "realistic," says, "The companies that bypass dealers may make some short-term gains, but it will hurt them in the long term. Site licensing requires no extra support and knowledge on the part of the company above and beyond that for the standard packages."

Neither Summa nor Sorcim employ copy-protection measures for their software packages. Sorcim's Crosno concedes that the code that restricts program duplication can be easily broken, "but by the same people who'd buy one copy of a program and copy it innumerable times. We're not trying to control piracy; we'll just keep

the good guys honest."

A Summa representative says that "a lot of competitors are obviously annoyed" that the program has gained steam, adding that some so-called site licensing agreements are only "thinly disguised volume discounts." The company plans to develop and acquire products, including desk organizers, to offer a full catalogue on a site licensing basis.

"Software publishers are confronted with a crashout when putting out a new product," says Scott. "They have to make a multimillion-dollar investment over the space of 90

days and hope it will be recovered. It results in an unacceptable financial circumstance for the publisher; the risk/reward ratio has an inadequate outcome. Many customers would be better off dealing directly with the publisher."

A prospective site licensee can acquire a sample Summa program for \$100. Scott requested that those interested in the company contact it directly at the following address: P.O. Box 2046 Beaverton, OR 97075. (503) 644-3212. Sorcim/IUS can be contacted at 2310 Lundy Ave. San Jose, CA 95131, (408) 942-1727. ■

H-P Hits Market With New Portable PLUS

NEW YORK—In a bid for the burgeoning lap-top market, Hewlett-Packard has enhanced its original portable computer. The company says the machine, called the Portable PLUS, is designed for use by managers and sales professionals who spend a lot of time traveling.

The Portable PLUS features an adjustable 25-line-by-80-character LCD display that can interface with full-size video monitors. Weighing in at less than 10 pounds, the machine has a 13-by-10-inch footprint. It includes two expansion drawers that can be configured with ROM and RAM chips, with a total capacity of 3 megabytes of

memory. An optional disk drive unit is also available.

Hewlett-Packard says the ROM and RAM circuits can store and retrieve data 10 times faster than a disk drive. Furthermore, the nonmechanical "E-disc" can better withstand shock and adverse environmental conditions, and a variety of software will be made available in this format.

The PLUS will retain data for 6 months while turned off. Battery power comes from permanent lead-acid-gel cell batteries, which must be recharged after 20 hours of continuous use.

The Portable PLUS lists at \$2,295. —By Charles Berman

Why waste time digging through cumbersome manuals for operating commands? PC-DocuMate™ templates put computer commands at your fingertips for the IBM® PC, PC-XT, Compaq®, Apple® IIe and Commodore® 64.

You'll have quick reference for needed commands, options and formats right on your keyboard with a PC-DocuMate template.

Our professionally designed, two-sided templates are made of durable, non-glare plastic. Satisfaction is guaranteed—fully—or your money back.

Templates Now Available—

IBM PC/XT and COMPAQ:
DOS/BASIC (2.0 & 2.1) • 1-2-3 •
Symphony • dBASE II • dBASE III
• Framework • MultiMate
• Wordstar • EasyWriter II •
MULTIPLAN (IBM or Microsoft) •
PeachText 5000 • SUPERCALC³
• VisiCalc • TURBO PASCAL •
WordPerfect • VOLKSWRITER
DELUXE • Do-It-Yourself.

PCjr: DOS/BASIC 2.10 • dBASE II
• Do-It-Yourself.

COMMODORE 64 (Single-sided):
C-64 BASIC • EasyScript •
CalcResult • Do-It-Yourself.

Apple IIe: AppleWriter II •
WordStar • VisiCalc • dBASE II
• Quickfile • Do-It-Yourself.

How to Order:
To order by credit card call toll free
1-800-762-7874

(In NC call 919-787-7703)

Or mail us your personal check, money order or MasterCard/Visa information.

NC residents include 4.5% sales tax. Please add \$1.50 for shipping and handling per order. (Foreign orders, except Canada, add \$15.00 per order). U.S. funds only. No CODs.

Our Guarantee: Use your template for 20 days. If you are not completely satisfied return it to us (undamaged) for a full refund.

... The never-ending search for the right software or hardware may be a lot simpler thanks to Direct-Net—an on-line product database devoted to PC hardware and software. Direct-Net users can search the database, which operates at 2400 baud, for a product (hardware and software for the IBM PC, XT, AT, PCjr, and compatibles), get information about the product, and then download and test many popular programs.

Direct-Net allows users to download and test software prior to purchase.

Craig Isaacs, marketing director of Direct-Net, says the service will be marketed to large companies and computer consultants but will be useful to anyone who uses many different software programs. There are over 100 software packages that can be demonstrated through Direct-Net, including *WordStar 2000*, *1-2-3*, *PC-Draw*, *PFS:Write* and *PFS:Plan*, *Enable*, *SPSS/PC* and *CROSS-TALK XVI*.

A subscription to Direct-Net costs \$50 a year, and connect time is charged at \$10 an hour. The subscription includes DNCOMM, the service's communications software. For further information, contact Direct-Net, 31220 La Baya Dr., #110, Westlake Village, CA 91362, (800) 223-0822 or (800) 824-5526 in California.

One Hundred Nineteen and Counting

Officials at MicroPro International say that printer support builds word processing sales, and as the makers of *WordStar* and *WordStar 2000* they are certainly in a position to know. Users of 2000 will be pleased to learn that the much-discussed word processing program will now support at least 119 printers, including the Hewlett-Packard LaserJet. MicroPro is also broadening the printer support of *WordStar* Version 3.3.

Free printer support enhancement disks will be mailed automatically to registered users of *WordStar 2000* and *WordStar 2000 Plus*. Registered users of *WordStar* Version 3.3 can get the printer support enhancements from their dealer or from MicroPro.

MicroPro's headquarters are at 33 San Pablo Ave., San Rafael, CA 94903, (415) 499-1200.

Reviving the Bundle

... Adam Osborne, the president of Paperback Software International (PSI), continues to gain attention for his company's line of deliberately low-priced software. He recently announced that his company's software will now be bundled with *Computer Frontier Ltd.*'s two IBM PC-compatible computers—the Tava PC desktop computer and the lap-top Tava Triumph LT Personal Computer.

Both computers will include copies of PSI's word processor, *Executive Writer*; a file management program that integrates with the word processor, *Executive Filer*; a spreadsheet program, *Number Works*; and a graphing and drawing program called *Draw-It*.

The Tava PC with 256K RAM, two disk drives, and the bundled software costs \$1,495. The Tava Triumph LT, which is set up with

the same configuration, is priced at \$2,695.

PSI is located at 2612 Eighth St., Berkeley, CA 94710, (415) 644-2116.

Possible Patent Infringement

... IBM, its Rolm subsidiary, and Wang are all being charged with patent infringement by Rob Elkins of Elk Industries, Inc. Elkins, who describes himself as the "father of digital-sound reproduction," claims that all three companies are using the audio storage and distribution technology he invented 15 years ago, later patented, and unsuccessfully tried to market to IBM.

Elkins claims that he invented a system that converts analog signals to digital representations that are either stored and/or distributed over a variety of communication devices. These digital representations are reconverted to analog signals to be used and subsequently controlled through a touchtone telephone. Elkins claims that IBM's Phone Mail system is an infringement of his patent. The suit, which was filed in Miami, Florida, is still pending.

Private Labels

... Adding to its line of private-label letter-quality printers, diskettes, and supplies, **Businessland Inc.** has introduced a private-label internal and external modem.

The BL1200 internal modem operates at 300 and 1200 baud and features automatic dialing, automatic answer, and automatic speed selection. It comes with Microsoft, Inc.'s *CROSSTALK* communications software and costs \$499.

At \$529, the BL1200 external modem has all the same features as the internal modem, but it does not come with software.

Businessland headquarters are at 3600 Stevens Creek Blvd., San Jose, CA 95117, (408) 554-9300.

Port or Star Board

... A new flexible adapter board with multiple serial communication ports has been introduced by **Star Gate Technologies**. The OC Series lets users add four to eight RS-232C/RS-422A serial ports to the IBM PC or AT.

The OC adapter boards allow PCs to tie into modem lines and communicate with mainframes and peripherals such as printers or plotters. They were designed to be used with multiuser operating systems such as XENIX, but the cards can be used with PC-DOS. Two highlighted features of the OC Series are an address decoder

Star Gate's OC Series gives users multiple serial ports.

and interrupted circuitry. The OC8500 interrupt device costs \$25.

A simplified cabling system is available for hooking up printers and other serial devices by using the OC8000 RS-232C Remote Panel and a single, 25-conductor ribbon cable.

The OC8000 (8-channel module), the Remote Panel, and the cabling costs \$470; the OC6000 (6-channel module) is \$420, and the OC4000 (4-channel module) is \$370. More information can be obtained from Star Gate Technologies, P.O. Box 764, Cleveland, OH 44026, (216) 831-5922.

Videotex Service Goes Expressly For Software

BY JAMES LANGDELL

FAIRFAX, Va.—Last year more than a half-dozen companies offered systems for distributing software electronically to customers or stores. Since then few commercial programs have actually been sold and delivered over the phone lines. Already many electronic distributors, such as Xante and Romox, have thrown in the towel. Other companies, such as Gimcrax, Inc. are trying other strategies besides competing head on with traditional distributors (see "Gimcrax Sales Fall Off-Line").

But one company, Software Express Videotex (SEV), now has a system up and running that's delivering software for the IBM PC over the phone. Is this the end of the line for software boxes?

Unlike previous attempts at electronic software distribution, SEV sells software of its own creation rather than trying to market programs already sold through retail channels.

Other on-line distributors failed, says SEV president Eric Gagnon, because "they were trying to sell the same \$300-\$500 software programs in a way that had no benefit for the consumer. I can't see anyone getting excited about buying software by making a \$300 phone call."

SEV's collection of original software is called the Master Selection—63 programs at prices from \$3.95 to \$27.95. All the programs are standardized to offer instructions and commands through a window format. The selection includes financial analysis packages, games, and utilities. One program is a shell for DOS that presents commands in window menus. SEV does not charge any additional

connect-time fees for the time used to download this software.

In addition, 175 public domain programs for IBM PCs are offered in the service's Software Channel library. Subscribers are charged only connect-time rates for downloading these programs, which are not equipped with the window format used in Master Selection programs.

A third collection of programs will be the National Software Exchange. Subscribers are invited to contribute their original programs and receive royalties when their software is downloaded by other subscribers. "User publishing was always a popular feature on The Source," says Gagnon.

All the available programs are described in a periodical catalog called *Download*. It lists the number of minutes it takes to download each program.

Source Start

Gagnon worked for The Source for 3 years before start-

Menu windows help you order and download programs from Software Express Videotex.

ing SEV. "We're a second-generation on-line service," claims Gagnon, because SEV was designed specifically for use by personal computer owners, while the older systems were set up for access by dumb terminals. The PC is used to display text in page format rather than having it scroll onto the screen line by line. The windows and extensive help messages are also generated by software running on the PC. "We're able to treat our mainframes more like file servers rather than having them take over our PC completely," says Gagnon.

Software Express's other on-line services are Minute Mail, which provides electronic mail among subscribers, and a mes-

sage and conferencing system called SwitchBoard. These services also use window commands and display their contents in page format rather than scrolling. The value of these communications services, however, will depend entirely on input from subscribers.

"We decided not to have news, stock quote, and research databases on SEV because they're not used by most subscribers," says Gagnon. "Dow Jones, CompuServe, and the Source are already superb at what they do. But your average user only hits on the AP or UPI newswire one or two times."

Gagnon saw that Source subscribers returned more frequently to download software and to communicate with other users. "By lashing the two together, we'll have the critical mass to succeed."

Nonprime access charges are about \$11 per hour. By using a packet-switching system, SEV is able to offer telephone access at local rates in 150 cities. During prime periods, from 6 a.m. to 6 p.m. weekdays, rates are considerably higher. Rates are the same for communicating at 300 or 1200 baud.

Software Express Videotex is offering free subscriptions to its service. To receive information, a software catalog, and a disk of communication software for easy access to the system, contact Software Express Videotex, 3251 Cambridge Court, Fairfax, VA 22030, (703) 352-3867. ■

Gimcrax Sales Fall Off-Line

Gimcrax, Inc. of Minneapolis set aside its plan to transmit the program code of retail software products to its customers. "Third-party software hasn't worked for us or anyone else in electronic distribution," says Gimcrax president Nathaniel Forbes. "The publishers are reluctant to get involved, so we decided to stop beating our heads against that wall."

Instead, Gimcrax is offering software transmission as a service for corporations that use a large number of PCs in their offices. Forbes explained that the employees in such companies create a lot of software such as dBASE routines, 1-2-3 templates, or full programs in BASIC or Pascal. For more efficient use, such programs can be stored in Gimcrax's SPEED>>S system. Other computer users in the corporation can then locate and download software that they might otherwise have had to develop from scratch.

If a company chooses, it can exchange programs with other users of SPEED>>S. Gimcrax's present customers include large insurance companies and "Big 8" accounting firms. Gimcrax, Inc. is located at 430 First Ave. North, Minneapolis, MN 55401, (612) 341-0920.

LEAVE THE COMPUTER... TAKE THE DRIVE!

With Maynard's Transport™— the Original Portable Hard Drive!

Now you can leave that heavy "portable" computer on the desk where it belongs and carry up to 20MB of data between home and office. Transport™ comes with easy-release cable and convenient carrying handle. Call or write today for product specifics.

Your Assurance of Quality:

- plated media, double shock-mounted drive
- extensively tested against rigorous performance standards
- backed by industry-leading 1-year warranty

Available in 10MB or 20MB.

Purchase your Transport™ and receive a carrying case at no cost (limited time offer).

Discover the most powerful

The IBM Personal Computer AT.

Hold on to your hat.

The IBM Personal Computer AT (for Advanced Technology) is based on the advanced 80286 16-bit microprocessor. This remarkable computer will run many of the programs written for the IBM PC, up to three times faster. You'll be able to recalculate large spreadsheets in seconds and retrieve files in a flash. And it's ideal for IBM TopView, the new kind of software program that lets you run and "window" several other programs at once.

The IBM Personal Computer AT has got the power (and price) to surprise you. In many ways.

Compatibility, expandability, networking too.

With the IBM Disk Operating System, the IBM Personal Computer AT can use many programs from the fastest-growing library in the personal computer software industry.

The IBM Personal Computer AT is also available with up to 3 million bytes of user memory to run multiuser, multitasking operating systems such as XENIX™. Volume upon volume of information is available at your fingertips. You can customize your system to store up to 20,000 pages of information at one time. And its keyboard helps you use all of this computing power more easily.

This member of the IBM PC Family is a powerful stand-alone computer that can also be both the

primary file server and a station on your network. With the IBM PC Network (which is so easy to

Attention IBM ATTM owners. Your choice of multifunction boards is about to be simplified.

Because once you find out what ECCELL has to offer, you'll have only one choice: ECCELL by Orchid Technology.

ECCELL is the only multifunction board with ECC (Error Correction Code). ECC actually detects and corrects memory errors *before* they do any harm. So you can keep on working without worrying about the disastrous consequences

of losing your data. In fact, ECC is so critical, virtually no mainframe or minicomputer operates without it.

And ECCELL is the *only* multifunction board with switchless installation; the same advanced technology chosen by IBM when they built their AT. Technology so advanced we can back it with an unprecedented 2 year warranty.

Want more proof? Pick up a pen and prove it yourself.

Then pick up the phone and call Orchid Technology at 415-490-8586.

Finally, advanced technology for the IBM AT.

IBM Network Behavior: A Clinical Diagnosis

An evaluation of one of the first working IBM PC Network systems shows that its prognosis is good.

FIRST PERSON

BY PETER SIMSON

Editor's Note: Duke University's Neurobehavioral Research Laboratory may seem a curious setting in which to learn about the IBM PC Network, but that was where Peter Simson was able to put the system through its paces. As a post-doctoral fellow in the Department of Psychiatry at Duke's Medical Center, he is involved in research aimed at better understanding the physiological basis of depression. The IBM PC Network installed for the research project was the first at Duke and reportedly one of the first in the nation. Simson's observations follow.

Having just completed installation of the new IBM PC Network for Duke University's Neurobehavioral Research Laboratory, I've had a rare opportunity to observe first-hand the network's setup and operation in a "real-life" application.

The network package consists of three basic components: the necessary hardware, DOS version 3.1, and the PC Network Program. The first step in the installation process involved attaching the hardware components of the network, a relatively painless task. Our system consists of an Enhanced Model AT serving three PCs, each equipped with one disk drive. That meant we had to place a PC Network Adapter Card in each of the four machines and then hook up standard CATV cabling from the back of each adapter card to a single, central-

ly located PC Network Translator Unit. An updated *Diagnostics* diskette was then used to confirm that all cabling was performed correctly and that the network hardware was functioning properly.

Following hardware installation, we had to create a number of subdirectories on the server's hard disk, copy the network software from diskette to the appropriate subdirectories, and inform the network program about the particular network configuration. A menu-driven installation program included in the package automates this process, although I found it created a number of unnecessary subdirectories for my particular applications and set up certain default conditions with which I was unhappy. However, once I became familiar with the workings of the network software, I was able to customize these and many other aspects of its operation.

Messenger Service

Once the server's hard disk is configured for use in the network, it is time to run the PC Network Program on each network computer, thereby linking up all the hardware. In our laboratory, I have each of the three "messenger" PCs logged onto a different subdirectory on the server AT; these subdirectories appear as root directories to the user. By using the appropriate PATH commands and the new network APPEND command (which extends the PATH command by searching for overlay and data files), I can prevent individual users from having ac-

cess to other users' subdirectories while allowing each user access to a variety of application programs.

The network program itself takes up an enormous amount of memory. My calculations revealed that, on the server AT, the program was eating up over 240K, including the 55K taken up by DOS 3.1. Each messen-

ger takes up about 100K, but the PCs presently access the AT hard disk at a noticeably slower rate than if they were accessing a floppy drive. This sluggish response for the PC messengers, I am told by IBM, is a limitation imposed by the network software. If network traffic is heavy, the response delays become more severe, although you can fine-tune the system by adjusting the time spent on server versus messenger tasks.

Our system has crashed twice, both times while running a popular memory-resident "desktop management" program, which appears to interfere with the memory-resident network pro-

Peter Simson and Prudence Goodson Simson, postdoctoral research fellows at Duke University's Neurobehavioral Research Laboratory, are among the first users of the IBM network system.

ger PC lost over 170K to the network program and DOS. Indeed, our 512K AT is unable to run *Symphony* when on the network because of memory limitations, and I would need to increase memory on the PCs well beyond 320K in order to run it.

As far as other applications go, I have tested *WordStar*, *Turbo Pascal*, *Microsoft's C Compiler*, *Lotus's 1-2-3*, and *BASIC A*, all of which work (some files, such as *WordStar* overlay files, must be given a "read-only" attribute using the new ATTRIB command included with DOS 3.1 in order to function properly when opened by more than one user at a time).

Traffic Jams

In terms of system performance, the AT still responds

quickly when on the network, but the PCs presently access the AT hard disk at a noticeably slower rate than if they were accessing a floppy drive. This sluggish response for the PC messengers, I am told by IBM, is a limitation imposed by the network software. If network traffic is heavy, the response delays become more severe, although you can fine-tune the system by adjusting the time spent on server versus messenger tasks.

Another fairly trivial complaint is that passwords entered by users at system bootup are echoed to the screen; they would be better off hidden from general viewing. Other than that, the system is functioning well. Network requests are made by accessing the network program in either "menu mode" or, for more proficient users, "command mode". The server and messengers are able to utilize printers located at other sites on the network and to send and receive network messages. The server also has good control over network operation: Not only can it control the sequence in which jobs are printed, but it also has the ability to determine which files are being used by given users at any time.

When They Make This into a Movie It Will Be Short and Inscrutable

Add to the myriad of cultural polarities between the United States and Japan the different way computer manuals are perceived. Izumi Aizu of High Technology Communications in Tokyo, who has written the manual that comes with Apple IIc's sold in Japan, says that

Japanese computer users want to know "the part before grasping the whole." To do otherwise, he adds, "can irritate the audience. We favor a gradual rather than a direct approach." For this reason, Aizu's brightly colored manual

has three chapters of introduction before coming to a basic tutorial.

Aizu says that any computer manufacturer who translates manuals directly into Japanese will lose the consumer's attention in no time flat. In fact, only one American company, IBM, takes the time to create new, original documentation. Aizu himself declined to be involved with those efforts because "they wanted me to explain DOS in 30 characters or less" as a test. He declined the challenge. ■

If I'da Known You Were Comin' I'da Baked Twelve Cakes

People who do a lot of heavy-duty entertaining and have found PC-based cookbooks too restricting can now rest easy. *Food for Fifty*, the standard reference tool for large-scale caterers, is now available as a software program. The \$795 nine-diskette package is perfect for anyone who wants to have

the whole neighborhood over for dinner.

The program's title is a misnomer, as it's designed to plan and project costs for either smaller or much larger groups. It is targeted for use in all institutions, from Ivy League colleges and executive dining rooms to prisons and school caf-

Wire Disservice

Yossarian Universal (named for *Catch 22*'s intrepid hero) may not become one of the big-three wire services, but they'll certainly pick up some fans. This farcical news bureau will generate short, satirical news items when it goes on line in a few weeks. One story the staff is currently covering is a report from Kansas that the image of Elizabeth Taylor has appeared in the bacon grease of a frying pan and is performing miracles. Ms. Taylor was not available for comment.

YU's motto is "unbelievable news for unbelievable times," and it will copy the style and method of distribution of the Associated Press and United Press International. Offering the service with The Source or CompuServe is a "possibility," says YU's Paul Fericano. And if UPI folds, YU could be hastily thrust into a position of being one of the world's top five news sources. Actually, if UPI doesn't fold . . . Well, never mind.

eterias. The recipe range is considerable. "Anything you would find in practical institutional feeding, down to the rice and string beans, is included here," says Robert Kilgore, director of marketing for The CBORD Group, which markets the package.

If you'd like to sink your teeth into the program, contact The CBORD Group, Suite 300, First Bank Building, The Commons, Ithaca, NY 14850, (607) 272-2410. ■

For more information and subscription rates, you can contact Fericano at P.O. Box 236, Millbrae, CA 94030, (415) 588-4163. ■

PC Galore

The microcomputer industry has arrived in Hollywood, having been acknowledged by one of the most sacred modern cultural icons, the James Bond movie. In *A View to a Kill*, the villain, played by Christopher Walken, attempts to achieve world domination by destroying Silicon Valley and seizing con-

trol of microchip manufacturing. Bond movies are supposed to test reality, but this one stretches things to the breaking point. Walken's malevolent character goes after Silicon Valley because the area supposedly accounts for 80 percent of chip production, neglecting the fact that chips are made in Asia, South America, and other places abroad. So much for criminal genius.

Despite all the movie's high-tech gadgetry, the only micro used in the film is an Apple IIc in Bond bimbo Tanya Roberts's bedroom. Evidently the villain was not out to dominate the MS-DOS universe, otherwise he'd have tried to destroy Boca Raton or the IBM Product Center nearest you. ■

Do you know me? I don't go anywhere without carrying a slip of paper that says, *PC Magazine*, One Park Avenue, New York, NY 10016; (212) 503-5276; MCI Mail 157-9301. That way, when I'm on the road and find a PC Communiqué, anything funny or unusual about computers, I can earn \$50. Hey, it ain't Pepsi, but it ain't bad. ■

Some Firms Only Understand a Slap in the Face or a Slug from a .45

It's not going to be easy for Management Information Systems to battle the mighty Lotus Development Company in court over its simplified 1-2-3 manual (see "Publisher Faces Lotus Lawsuit," PC, Volume 4 Number 12, p. 35). But if they lose much of their first-quarter profit to legal bills, they don't have to lose their sense of humor.

MIS has unveiled a poster that satirizes the pulp detective films of yore. A decadent, tearful woman in a trenchcoat—and

little else—is given the boot by a shady figure while positioned under the banner "The Book Lotus Wants Stopped." It will be run as an advertisement in several publications.

(We at PC find the tactic amusing, and some of us have even sunk to the level of putting the poster on our office walls. Still, the use of an out-of-context quote from PC in this ad may give some readers the incorrect

impression that we sympathize with the MIS position in this matter. We remain neutral about the issue. We are not so neutral about the poster.)

MIS, 3543 N.E. Broadway, Portland, OR 97232, is sending out the poster with a \$2 fee. ■

Beats the "Association for the Philosophizing About Peace, Love, and Everything"

New Yorker Scott Gardner needed a name for his organization charged with solving all the world's major problems. He came up with the Institute for the Betterment of Mankind—Problem Clinic, or IBM-PC.

The name is appropriate, he explained, because an IBM Personal Computer led him to discover solutions to "poverty, baldness, runaway inflation, political corruption, and the proliferation of nuclear weapons and cockroaches," although not in that order. Using his PC, he was stricken with "an absolutely irresistible impulse to write; but about what, I

did not yet know."

His processed words proved to contain modest proposals, such as one that would save the U.S. economy and end world hunger by backing our currency with the potato knish standard.

Trying to come up with a suitable name for his organization, he, as he recalls, "stared at my computer for a while, and the IBM PC's name just came to me, out of nowhere."

A collection of Gardner's worldly solutions is available from Draydel Press, 36 West 56th St., New York, NY 10019. It's titled *Stop Me Before I Write More*. Let's hope so. ■

Bugging Out

Microsoft Press has named as its publisher Min S. Yee, who comes to the organization from Ortho Information Services, a division of a company that's best known for its powerful insecticides. Perhaps Yee will use his past experience to help Microsoft work out the, er, bugs and keep the varmints out of future versions of Windows and Word. ■

Search and Replace Journalism

It occurs to me that somewhere in the manual for the widely popular WordStar word processing program there must be an assignment of the following kind: "To demonstrate you've mastered the features of this program, write a short book on computers and send it to a publisher. Take no more than two weeks for this exercise."

Langdon Winner, "By Words Processed"
The New York Times Book Review, May 19, 1985

The Mole's Gone, But The Memory Lingers On

A good computer joke is hard to find. This one, from *Mole*, a Washington-based humor publication, went predominantly unseen because the magazine folded soon after this issue hit the stands last year. Conceived by writers Art Levine and Bill Thomas, the ad was part of *No Money*, a parody magazine for the "downwardly mobile." If you mail \$2 to *Mole* they won't send you a poster, but they will use the cash to refinance the publication. ■

International Connections

With the industry's most popular data communications program, the world is at your command.

An import/export office in New Jersey can instantly check the London market for current dollar exchange rates ... send Hong Kong an updated production schedule ... print-out the week's sales results from the Dallas branch.

There's virtually no limit to how far you can reach with your microcomputer, ordinary telephone lines, and CROSSTALK.

Even if your own business and personal needs are closer to home, you'll appreciate CROSSTALK's compatibility with a wide user base ... smart terminal characteristics ... total modem control ... and the ability to capture data at a high speed for later off-line editing. CROSSTALK has extras you may not find in other programs. Data capture to memory buffer (and on-line display). Protocol error-checking file transfer. Modern/telephone hangup, and display of elapsed time of call. Command file power and flexibility. Remote takeover and operation. And much more.

There is a CROSSTALK version for almost every CP/M, CP/M-86, or IBM DOS based microcomputer system. See your dealer, or write for a brochure.

Don't buy a disk/tape system that can't grow with you.

Get the Sysgen™ XL™ *expandable* hard disk and tape back-up system.

Most popular disk/tape systems offer 20 Megabytes of hard disk, plus a 20-Megabyte tape back-up.

That may seem ample now, but do you know whether, a year down the road, 20 Megabytes will give you enough storage?

You don't. So it makes sense to get the *only* disk/tape system that gives you room for expansion later on.

And that doesn't cost you any more now.

The new Sysgen XL comes with 20 Megabytes of fast, reliable hard disk storage, a built-in 60-Megabyte tape for fast, reliable back-up, *plus* room for an additional hard disk drive.

What happens if you later need more hard disk storage?

With the XL, you simply add a second 5¼" disk drive. It fits inside the cabinet, and plugs right into the XL controller.

You can add an additional 20 Megabytes, and back-up with a single pass of the 60-Megabyte tape.

Or add up to 100, and back-up with two tapes.

With the low cost of hard disk drives, expansion is *much*

more economical than buying a whole new \$3,000 system. Plus, you save desktop space by expanding *inside* the cabinet.

The XL sells for \$3,295, including cabling, host adaptor, and utility software. You get everything you need.

(Watch out. Some companies charge extra for cabling and the host adaptor.)

Installation? Just snap in the controller, plug in the system, install the system software, and you're running.

Compare before you buy:

You'll find the XL to be the outstanding disk/tape system for your PC, XT, AT™, or compatible today. And the only system that can expand for your needs for tomorrow.

Epson Does Battle With IBM Armed With Special FX

PRODUCT REVIEW

BY JOHN DICKINSON

NEW YORK—For those of you who don't think a global war is raging in the dot matrix printer business, consider the following events of late spring and early summer.

IBM announced a brand new, domestically designed and produced \$549 desktop printer capable of 200-cps speeds, near-letter-quality printing, and single-sheet (including envelope) paper feeding. This new printer, the Proprinter, replaced the company's PC Graphics printer, which was built in Japan by Epson.

Outwardly, Epson America seemed calm about IBM's new Proprinter (see "Epson Not Blue over IBM Split," *PC*, Volume 4 Number 14, p. 38). One spokesman asserted, "We're not surprised by IBM's announcement at all." Indeed they weren't. Apparently Epson was been quite well prepared for IBM's thrust onto its traditional turf, and it seems safe to say that "the Empire has struck back."

As *PC Magazine* staffers and free-lancers were in the midst of testing Epson's upgraded, and significantly improved, FX-80 Plus printer for the forthcoming Project Printers update issue, a call came through from Epson's Torrance, Calif., headquarters. "Drop everything," said an Epson spokesman, "We just put a brand new FX-85 printer on an airplane bound for New York."

What's an FX-85? Clearly it's Epson's response to IBM's

Proprinter, and its features and performance show that the wily Japanese company is prepared to do battle with Big Blue. Epson's new printer incorporates the improved paper mechanism and other mechanical improvements of the FX-80 Plus and adds two significant fea-

ture), and the printer comes in at a startling \$499. The companion FX-185, a wide-carriage version that incorporates all the FX-85's features, will cost only \$699.

Perhaps the best news of all is that Epson hasn't abandoned its earlier FX-80 and FX-80 Plus

Clearly the FX-85 is Epson's response to IBM's Proprinter, and its features show that the company is prepared to do battle with Big Blue.

tures. The FX-85 can produce the entire IBM PC character set, including the text graphics characters and both foreign language subsets, and it produces a near-letter-quality (NLQ) mode that rivals all but the best 24-pin Toshiba printers. Its NLQ mode is clearly superior to the Proprinter's.

Maintaining Tradition

Epson hasn't abandoned its own traditional character set in the FX-85, or its low-price reputation. The FX-85 can still produce Epson's traditional italic characters when in native mode (you can use an easily accessible DIP switch to set the IBM

customers. Upgrade kits for these two favorites will be available shortly for dealer installation. The price for the upgrade, not yet final, is expected to be in the \$75 to \$85 range.

Rated at 160 cps, the FX-85 isn't quite the high speed performer IBM's Proprinter is. It clocked an even 80 cps in draft mode, versus the IBM's 91, and in near-letter-quality mode, it ran at 21 cps, while the Proprinter did 31 cps. (The tests were run using *PC Magazine's* standard printer speed test.) But, Epson's new printer is significantly quieter than its counterpart, rating a mere 75 dBA versus the Proprinter's near ear-

popping scream of 82.

The FX-85 includes all the Proprinter's highly touted features but goes IBM's product one better by adding proportional spacing. And then, of course, many people find Epson's standard italic characters desirable for word processing applications. Both printers are compatible with the DOS GRAPHICS screen dump facility, but that's no surprise since Epson invented the standard by which IBM graphics compatibility is measured.

Double Dipping

One minor problem with the FX-85 is that standard Epson features such as 12 pitch, italics, and proportional spacing are not available while the printer is hard at work in its IBM mode. A front-panel switch, however, gives you access to the near-letter-quality feature. As a result, most users will probably end up using the printer in Epson mode for word processing and IBM mode for other applications. The easy accessibility of the FX-85's DIP switch reduces this change to a petty annoyance rather than a real problem.

Single-sheet feeding is available in the FX-85, and envelope feeding is possible. But the Proprinter's design is clearly superior to that of the FX-85 for feeding both single sheets and envelopes. For that matter, the Proprinter has it over just about anything else on the personal computer printer market in this particular area.

But the Epson Empire has, indeed, struck back with the FX-85, and swiftly at that. Will the blow be strong enough to throw back Big Blue's invasion of its traditional turf? It's hard to say. If an 11-cps difference is enough to make you spend another \$50 for a US-made product with IBM's logo on it, the Proprinter will win your heart. But, if superior near-letter-quality printing and quiet operation are more your style, you'll go for the Epson. Given that Epson printers are more heavily discounted than anything made by IBM, you may just decide to sit under the rising sun in any case.

Introducing "The Company Accountant."

Designed for the small business, The Company Accountant works for you, providing the timely and reliable information needed to develop strategies and make good management decisions.

With the GL, AR, AP, Payroll, and Inventory programs that provide over 51 easy-to-understand reports, The Company Accountant handles your small business accounting needs now and in the future.

A system to fit your needs

The Company Accountant is built to be flexible with programs that can be tailored to your needs. The programs can be used individually or together, with each program fully explained in the clearly written manual.

The manual reviews basic accounting principles with a comprehensive tutorial, a command and report reference, and a complete glossary of accounting and computer terms.

System Requirements

IBM PC, XT, AT or true compatible with 128K RAM.
Monochrome or color monitor, DOS 2.0 or greater, 2.525K disk drives or 1.252K disk drive and 1 hard disk. Printer capable of 132 columns.

Speed and accuracy

The Company Accountant is a fully integrated system that makes accounting fast, efficient, and accurate.

Using the double entry method with complete integration, you only enter figures once. And they are always current as of the last transaction.

On demand, The Company Accountant provides a wide variety of reports, ranging from the familiar balance sheet and income statement to customer and vendor activity, payroll information, inventory values, and stock levels.

Double entry, plus...

- Password security
- Hard disk support
- Capacities limited only by disk space
- Creates DIF files for use with other programs
- Data compatible with:
 - Rocky Mountain Desktop Accountant
 - Peachtree PeachPak 4 series
- Multiple departments, up to 99
- Customer and vendor mailing labels
- Full audit trail and control reports
- FREE telephone support

Great price

Now double entry accounting becomes simple, reports easy and fast, and your bottom line instantly accessible. And at \$395, very affordable!

To order The Company Accountant, or for more information, pick up the telephone and call (503) 639-4907 TODAY!

PC UPDATE BY VIRGINIA DUDEK

NEW YORK - Those who think in Gantt and Pert charts may be interested in Applied Business Technology Corporation's updated Project Manager Workbench. Version 2.1 can now preview on-screen output reports on the system and then integrate them into a word processor. This lets users take one or more reports from the system and rearrange documents that are suitable for presentations. For resources that are part of more than one project at a time, Version 2.1 can report on and manage resources across projects. Also, the Gantt chart calendar scale is increased to a maximum of 45 time periods, broken up into either weeks or months. Worth mentioning: Version 2.1 requires 384K of memory.

Updates are available from ABT. If you bought the maintenance contract (\$250), you'll automatically receive one. If you bought Project Manager within 90 days of the update's release, ABT will send you Version 2.1. Contact ABT in New York for details.

If there's a draft in the room, it could be because Autodesk, Inc. of San Rafael, Calif. has released Version 2.1 of its AutoCAD design package. New features include a 40 percent speed increase over Version 2.0 for users with math coprocessors, an interactive pick function that prompts users for design information like coordinates, and a variable and macro facility for creating custom commands and functions. The Advanced Drafting Extension 3 module's visualization capability (or "2 1/2-D") edits, creates polylines, and performs wire framing and hidden line drawings. In addition, Autodesk and CADCOR of Mountain View, Calif. have developed a translator that moves files between AutoCAD and IBM's CADAM mainframe design software. "This is what the microcomputer revolution is all about," claims Autodesk president John Walker. Upgrades to Version 2.1 cost \$500. Contact Autodesk for details.

Just out from Digital Research of Monterey, Calif. is Version 4.1 of

Concurrent DOS. The multitasking, multiuser operating system now allows micro to run MS DOS or CP/M application programs simultaneously. Two attached aerial terminals may be added that each run one additional application at the same time. This means up to three users can operate one computer simultaneously. Version 4.1 also runs on the AT&T 6300, the Compaq Deskpro, and the IBM PC AT, and includes integrated networking capabilities. Contact Digital Research for upgrades.

Decision Support Software, Inc. of McLean, Virginia announced Version BE3 of Expert Choice. The decision support system now has a link to Lotus 1-2-3 and an enhanced what-if capabilities that lets users adjust a numerical value in a what-if situation and have that difference equally distributed over other criteria. A "quick and dirty" feature lets users weight decisions numerically and thereby make fast on the spot decisions. Updates are available directly from DSS. Send \$50 for new program disk and additional documentation or \$75 for new program and a new manual.

Short takes: Version 2.0 of iRr's WP Toolset now converts from the IBM DCA RPT format to the ASCII format, but NOT from ASCII to RPT. Also added are ASCII/EBDCIC translation and a filter to transform files according to any set of substitutions provided by the user. Contact iRr in Concord, Mass. for upgrades. Release G of Network REVELATION from Coamos, Inc. in Seattle, Wash. now runs on IBM's PC Network, Nestar's Plan 3000, and other networks running Novell NetWare. A new file structure offers 10 times faster access time. Note that all previous versions will run on Release G; however, object code generated with G is incompatible with Release F and earlier. Registered users send \$100 for new manuals and system disk. For system disk alone send \$50.

Be a contributor to PC Update. Write or call Virginia Dudek, PC Magazine, One Park Avenue, NY, NY 10016 (212) 503-5265.

Borland's Kahn Wages His Big Macro Attack

BY STEPHEN MANES

Since the introduction of Borland International's feature-laden SuperKey package in late May, one of the hottest battles in the PC world has raged over a product once considered a lowly utility: the macro processor.

"I don't think you can get a better bargain in micro software today," crows Borland president Philippe Kahn, itemizing SuperKey's file encryption, keyboard and screen control,

DOS command editor, and macro functions.

David Rose, ProKey's inventor, doesn't agree. "We don't think a features war is good for our customers." Although his ProKey 4.0 has many new functions, Rose emphasizes his product's reliability and service. ProKey has been on the market since August 1982.

"Customers want support, cooperation, and synergism among products," Rose says. Critical of Borland's failure to

make its SideKick desktop program fully compatible with his already-established product, he characterizes the firm as "secretive and aggressive."

Rose notes that ProKey is widely available between \$75 and \$85, not much more than SuperKey's \$69.95 introductory list price. With a site, multiuser, or OEM license, he adds, "the cost per unit can be far lower than Borland's price."

Kahn considers that comparison unfair. He points out that his firm's products, are often sold at discounts from the list price. Borland has also been involved in the licensing

"Anytime anyone wants to know something about our products, we're very open," Kahn says, pointing to Borland's involvement with the Pascal standards committee. The firm is currently consulting with Microsoft to ensure that its products will work properly with DOS 4.0. "We try to do products that are the best in their category, regardless of price. We could sell SuperKey for much more," says Kahn. "We want to open up this market."

On that final point at least, Rose agrees. "We're glad that the press is paying a great deal more attention to this niche of the market."

We've Put a Local Area Network on a Disk

Corporate Information Sharing. It's been described as the key to increasing a company's productivity. It's also why large networks of PC's are becoming more and more common in the workplace...in spite of the fact that they're costly, difficult to install, and incompatible with much existing software.

Finally, there's a solution to this corporate dilemma. Its name is LANLink™

A Software-Driven LAN That Uses Standard, RS-232 Ports. A major breakthrough in local area networks, LANLink™ uses your computers' existing serial ports and runs under PC-DOS.

Because all of the intelligence the network requires is on the server and satellite diskettes, expensive network interface boards aren't required.

A Powerful Network That's Cost-Conscious. If you've been pricing board-driven LAN's, you already know that they can cost over \$1,000 per workstation. LANLink™ is different.

Boasting a data transfer rate in excess of 100,000 BPS, LANLink™ is compatible with a wide range of programs. And because special boards aren't required, installation costs are one-third that of a traditional network.

A Network Designed the Way Business Works. With LANLink™ you're able to customize your network along departmental lines using a data-sharing hierarchy and password-protected access.

Get Started With LANLink™ TODAY. Call The Software Link TODAY for complete details and the authorized dealer nearest you. The LANLink™ Starter Kit, priced at \$495, comes complete with network software for both a server and a satellite computer. For a limited time, 50 feet of RS-232 cable will be included free of charge.

LANLink™ is immediately available and comes with a money-back guarantee. VISA, MC, AMEX accepted.

Keyport 300: A Functional Alternative to Keyboards

When Hollywood swings into its next horror film cycle, I fully expect the movie moguls to aim at today's nouveau-Yuppie audience with a feature called *The Keyboard that Ate the Office*. For the last hundred years no device has struck as much fear in the hearts of executives as the common typewriter keyboard. A confrontation with one can turn the most macho executives, those who would laugh in the face of a werewolf, Dracula, or Joan Rivers, into quivering, gibbering wrecks.

Little wonder, then, that one of the bubbling subindustries in personal computing concerns itself with keyboard alternatives: voice recognizers, mice for finger and foot, joysticks and trackballs, touch screens and touch tablets—everything but mindprobers, and maybe even those come next Thursday.

While the motivation behind many of these products seems to be that the world needs a new interface philosophy or metaphor, Polytel Corporation is more modest. The folks there apparently believe all we need are more and better function keys.

The result is a new product, the Keyport 300, a touchpad with a difference. Instead of free-form drawing—something even a keyboard coveter like me will concede is not QWERTY's forte—the Keyport 300 promotes itself as being a giant array of function keys.

Peter Maxed-Out

The Keyport 300 even looks exciting, a fantastic plastic overweight drawing board with an interchangeable mylar overlay decorated with what looks like a combination of an over-charged rainbow, press-on let-

ters, Marc Chagall remnants, and visual symphonies produced by a large dose of lysergic acid diethylamide.

The seemingly random explosion of word and color is not without design. Various function keys are delineated by color and position on the large pad. Instead of pressing strange key combinations to make your favorite word processor or spreadsheet (or even the one that you use and constantly complain about) bend to your wishes, you just need to tap the right place on the Keyport 300.

The enhanced function key concept is hardly unique to the Keyport 300. Compared to most other add-on arrays of function keys, however, the Keyport 300 holds an advantage. The wild and colorful free-form layout of the command selection areas should make it easier for you to fight through the forest of its functions. The colors and key arrangements help you quickly find and remember every function. At least you aren't confronted with 10 thousand look-alike keys.

As a side benefit, the Keyport 300 plugs into a game adapter, and so you don't have to tie up a valuable serial port to use it.

Rough Edges

Alas, the Keyport 300 is far

from perfect, both in design and implementation. Like most brand-new products, the Keyport 1 received had a few rough edges. Polytel's workmanship proved far from precise. The overlays did not properly fit onto the alignment pins on the Keyport 300 pad, curling and bucking no matter how I installed them.

Although the software Polytel supplied, called *Keyware*, was good, it could not work miracles. Many wonderful functions stenciled onto the command overlays won't work with all programs. Adding an overlay won't give *WordStar 3.3* an Undo key, for instance.

Dig deeper and you'll find more bothersome problems: Using the Keyport 300 in the office may slow things down, even if you are only an adequate typist. Positions and colors may be easier to learn than the keyboard, but after you get going, you'll have to move your fingers from their precious home row on the keyboard and then move them back. If you do a lot of editing, not only will things go slower, but your arms will get tired. The Keyport will cause more fatigue and be a big time-waster. On top of all that, it adds more clutter to your desk.

As an office worker, I would be content if the Keyport 300 in its present form would crawl back into the black lagoon from which it emerged. But underlying the Keyport 300 is an important technology, one I'll wager we'll be seeing more of.

But forget about using the Keyport 300 for the office-based PC keyboard. It can be a more valuable tool for machinists. In the hands of a machinist running a lathe or boring mill, it

may be the perfect interface. Able to withstand harsh environments and harsh words and equipped with enough room on the board for innumerable commands that can be quickly found and remembered, the Keyport 300 can serve as the primary control for the PC that runs the whole shop.

Dream Machine

If you take the Keyport 300's underlying technology another step, the Keyport 301 might become every editor's dream and perhaps the most natural working interface imaginable. Here's how: Instead of overlaying the Keyport 300 pad with an immutable plastic sheet, lay the pad (or a transparent version) over an LCD display, or lay a flexible LCD display over it. Mix in one grandiose software package that allows you to take your stylus and circle the words or the spreadsheet cells that appear on the pad and move them by leading them along with the stylus. Presto! You have an editing tool par excellence, one that will save keystrokes and restore some familiarity to the editing process.

Oh, sure, you can do the same thing today with your CRT, a light pen, and some software no one has bothered to write. Light pens, however, can be amazingly heavy when you use them for any length of time (although they too have their strong suits).

The pad-and-LCD combination can put the visual medium back into your hands—exactly like the familiar sheet of paper on a clipboard. I bet that would fix some vision problems, and make people a lot happier with their computers. ■

Paradise will send you a check for \$50 when you send us your old IBM Monochrome Card or Hercules Graphics Card with proof of purchase and a Paradise Modular Graphics Card warranty. Offer expires 8/31/85.

The Paradise Modular Graphics Card is the only video card that runs all popular IBM color/graphics software—full-screen—on an IBM (or equivalent) monochrome monitor. *Unmodified.*

Right off the shelf.

And not just ordinary monochrome: Crisp, full-screen, flicker-free monochrome graphics translated in up to 16 shades.

- Includes IBM-compatible color graphics on an RGB or composite video monitor.
- Optional memory (up to 384Kb), clock/calendar or floppy disk controller, and parallel, serial or game ports available.

*All in a single PC or XT slot.
This may be the only card you'll ever need.*

Note Well—Dragonfly Founders Plan to Soar

BY STEPHEN MANES

Four years ago Steven Siebert was a graduate philosophy student who had never so much as laid hands on a computer keyboard. Today his company, Dragonfly Software, is emerging from its pupal state with a high-flying takeoff. *Nota Bene*, Dragonfly's new integrated word processor and text-based management program, has just become the first program to receive the official blessing of the influential Modern Language Association (see "MLA Gives Top Grade to Dragonfly Software," *PC*, Volume 4 Number 15, p. 64).

He joined the computer age in November 1981, when he bought a 64K single-drive IBM PC to help with his Yale doctoral dissertation, titled "The Hermeneutics of Suspicion." After cutting (and gnashing) his teeth on *EasyWriter I*, the only word processing program then available for the PC, he switched to *The Final Word* the moment it arrived. Still, he soon was hunting for more capabilities than even that relatively powerful program had to offer.

Star Search

In that quest Siebert, now 32, became a fixture at meetings of the New York PC User Group meetings, where he was noted for railing against his *bête noire*, the word processing standard *WordStar*. Fellow academics ready to take the PC plunge but unable to find knowledgeable dealers quickly adopted him as their computer guru. Siebert parlayed his knowledge of their needs into a part-time hardware and software consulting business run from his one-

bedroom brownstone apartment.

Still working on his dissertation, Siebert kept hoping for better software to come along. He envisioned a single word processing program replete with features important to scholars—footnotes, table of contents, indexes, bibliographies—and including a special

Though outside investors offered assistance, Siebert chose to tap family resources for capital and sweat equity instead. When his wife, Deborah Reumann, discovered her job as coordinator of a Brooklyn shelter for the homeless would no longer include a salary, she joined the project, heading up the mar-

Dragonfly's triumvirate: Deborah Reumann, Steven Siebert (top left), and Loren Siebert.

free-form database manager to allow unlimited retrieval of text.

In 1983 two new products gave him a glimpse of what he was after: *XyWrite II*, a fast, powerful word processor, handled footnotes better than any other program he had seen; *FYI 3000* was able to index free-form text files. Originally Siebert intended to develop simple *ProKey* macros to offer a rudimentary interface between the two programs. But favorable response to a preliminary version he exhibited at the MLA convention in December 1983 convinced him to "do things right." He decided to license the two packages and modify them to work as a unit.

ket effort. Siebert's brother Loren added an infusion of cash and then abandoned his job as a technical writer in Japan to create the documentation for *Nota Bene*.

Academic Needs

Siebert takes pains to emphasize that *Nota Bene* is not just a repackaging of its two component parts. "Both are excellent programs," he acknowledges, "but we've added many features and modified the programs extensively to work as one unit." He points to *Nota Bene*'s unique logical keyboard layout, versatile footnoting, indexing, bibliography, and style options, printer support, and its facility with foreign characters whose

accents, umlauts, and tildes give many word processors fits. "One reason I decided to get into this was discovering that the MLA's own mainframe database can't handle foreign characters. Ours can."

Dragonfly believes the program is not just for ivory-tower types. Siebert says the free-form text database will be particularly useful for future revisions to the program's documentation and adds that lawyers, journalists, and others who store multiple versions of similar documents or take copious notes are already among *Nota Bene*'s boosters.

Like many software projects, *Nota Bene* was plagued with delays. Siebert ruefully admits he originally promised a finished product for January 1984; Version 1.0 of the program shipped on Valentine's Day 1985. One major frustration was copy protection, which Dragonfly is abandoning. Version 1.1 of *Nota Bene* will be what Loren Siebert calls "copy-traceable": The program may be copied after the master program is installed, but all copies can be traced to the source since the installation procedure requires that the original user's name become a permanent part of the startup display. Siebert hopes this will prevent unauthorized users from obtaining free upgrades and might be useful in tracking pirated versions of their program. Version 1.1, which began shipment in June, includes form- and mail-merging features and a built-in programming language for inveterate customizers.

The Dragonfly group was delighted when Version 1.1 flew out the door of its tin-roofed offices above downtown Brooklyn's Fulton Mall (and, soberingly, across the hall from the city marshal's process-serving division). "None of us has had a paycheck since we started this," says Siebert.

And what about "The Hermeneutics of Suspicion"? Well, so far, Siebert just hasn't had time to work on his dissertation with the tool he designed expressly for that purpose. ■

The MicroAge Of Television

BY CHARLES BERMANT

TEMPE, Ariz.—“Live! From Tempe! It’s Thursday Afternoon!” Well, not quite. There won’t be any crowded bars with eager viewers watching on a 6-foot screen, but MicroAge, a major computer retailing firm, expects “mahhhvelous” results from MCS-TV.

MCS-TV is a venture in “narrowcasting,” producing and sending television programming to a narrowly defined audience. In this instance that audience is MicroAge’s dealers and customers.

The service, with 20 hours of weekly programming, is part of the chain’s philosophy of service, training, and support that accompanies each sale. Jeff McKeever and Alan Hald, president and chairman of MicroAge, respectively, say they have attempted to sell their customers total systems solutions long before integrated hardware configurations were offered by manufacturers.

With about 150 stores nation-

MicroAge’s Jeff McKeever (left) and Alan Hald

wide and more in development, MicroAge is possibly the fastest-growing franchiser in the trade, especially in light of its 36-store total just 2 years ago.

Cult of Systems

McKeever and Hald don’t accept just anyone into the MicroAge fold. Hald says that the four requirements for a client are an overall business maturity, ability for sales management, understanding of technology, and adequate capital—it takes \$300,000 to \$1 million before a franchise’s doors open.

McKeever says that micro-

computer retailing is now in a period of change, similar to the transition from the hobby stores to the early computer retailer. He adds that a “smell of death” permeates office equipment stores, and he expects those outlets to be replaced by systems-

oriented outlets. MicroAge, in fact, offers office supplies in several stores.

He says PCs are now starting to be used as productivity and organizational tools. “Computer dealers will need both sales and technical expertise to succeed, and a background in systems integration rather than just peddling boxes.”

“The original concept of MicroAge was to be a solution store,” Hald says. “We wanted to solve problems instead of selling technology for its own sake. You can’t just retail a product. Buying the cheapest product is the worst way to buy.”

Nor does he have a complimentary view of other computer stores. “The concept of a PC store is on a dead end evolutionary path,” he says. “They have a myopic mentality. I compare

it to people sitting on the curb of a highway: They see that there’s something on the other side of the road, but when they get up to cross, they’re so myopic that they can’t see the cars coming and get hit.”

I Want My MCS-TV

When MCS-TV goes on the air this fall, it will be beamed to 20 MicroAge stores on a test basis. Half of the programming will be vendor-sponsored training, while MicroAge will sponsor specific programming for the other half. Hopes are that MCS-TV will be in every MicroAge store in 1986.

Some of the proposed programs are “Building Your Construction Sales,” “Multiuser Systems and LAN Update,” and “Selling Open Systems Accounting Software.” Product announcements will be included, and many programs will be interactive, allowing those in MicroAge stores to participate.

In a way MCS-TV is a real-life version of the old joke about TV programs interrupting the commercials, and there is little worry that Ted Turner will try to take it over. However, if McKeever and Hald are correct, their foray onto the airwaves might just change the way PCs are sold and supported in this country. ■

TRANSMISSIONS BY CRAIG L. STARK

A linkup to the lowdown about what’s happening on PC Magazine’s Interactive Reader Service.

Now logging nearly 100 calls a day, PC’s Interactive Reader Service lets readers use their modems to download programs, utilities, indexes, and the like, as they are published in *PC Magazine*. This column will keep you up-to-date on what’s new on PC-IRS.

If you’re not already among the several thousand readers already using the system, here’s all you have to do. Set your modem for 1,200 (or 300) baud, no parity, 8 data bits, 1 stop bit (our recommendation, though we will automatically adjust to other common settings), and set up to receive using the Xmodem file-transfer protocol. If your communications software does not support Xmodem (like older versions of *CROSSTALK* and

SmartCom II), we can transmit all but .COM and .EXE files to you in straight ASCII. Xmodem’s built-in error-checking capabilities make it the method of choice for all downloading, however.

You can call PC-IRS at (212) 696-0360 24 hours a day, 7 days a week. The service is free (except for your phone bill). If you get a busy signal, keep trying: At present we can support only two users at once, though we will soon be installing a seven-user system. If your display is blank or full of obvious garbage

when you connect, just hit a carriage return or two and you should receive our sign-on screen properly.

PC-IRS will continue to supply the full assembly language listings (.ASM files) for our Programming Column offerings, even though space requirements have forced us to curtail printing them in the magazine. The .COM, .ASM, and .ASC (BASIC) files for Steve Holzer’s SNAPSHOT, KEEPER, and CACHE utilities (Volume 4 Numbers 14-16) are the most recent Programming fea-

tures available in a list that includes all columns back to December of last year. Core International’s DISKPC.EXE hard disk benchmark test continues to remain popular, as are our listings of PC user groups (PCUG) and additional PC bulletin boards (PCBBS). PCNDX1.TXT and PCNDX2.TXT, our two-part index to all issues of *PC Magazine* Volume 3 (1984) take a while to download (117.5K and 34K, respectively), but they can save you a lot of thumbing through old table of contents.

Our directories of downloadable files grow almost daily, often in response to the requests you make through our Comment facility. So check out our listings the PC-IRS way. ■

All of a sudden, Lotus[™] 1-2-3[™] is 30 times faster, safer, and easier.

Recalc⁺ for 8087 Now you can accelerate your Lotus 1-2-3[™] calculations by an order of magnitude. The new Recalc⁺ software reroutes your data stream to Intel's 8087 coprocessor, using its dedicated high-speed math capability to dramatically reduce computation time. The more complicated the calculation, the more time you save.

Full-minute recalculations can now run in as little as two seconds (30 times faster).

Best of all, this quantum leap in productivity is just \$95 for Recalc⁺ alone—if you have an 8087 chip. Or \$250 for Recalc⁺ with the 8087.

Password⁺ Lock your Lotus! The new Password⁺ electronically locks and unlocks any of your 1-2-3 and Symphony[™] worksheet files.

The unique Password⁺ protection system allows you to enter a password of up to any 36 characters.

Keep your confidential data confidential. For just \$49.

Macro⁺ It's an ingeniously quicker way to program Lotus. New Macro⁺ "Learn Mode" displays and stores key strokes as you type them. Now you can create macros in an instant. Macro⁺ also lets you create and save 10 "hyperspace" macros that do not take up space on your worksheet.

What could be easier than 1-2-3? Macro⁺. For just \$49.

Order toll free today.

All these new programs are available now are not copy-protected. For immediate delivery, just call us and use your credit card.

Call toll-free 1-800-TEAM-GNP.

(From California call 1-800-MEET-GNP)

or contact your computer or software dealer.

GNP

GNP Development Corporation
1244 East Colorado Blvd., Pasadena, Ca. 91106 (818) 577-2550

*Using Intel's 8087 coprocessor, Recalc⁺ will run calculations up to 30 times faster. Use of Recalc⁺ and Macro⁺ requires the use of 1-2-3[™] made by Lotus Development Corp., use of Password⁺ requires use of 1-2-3 or Symphony[™] made by Lotus Development Corp. GNP also offers CPA⁺, the accounting program for Lotus 1-2-3 and "Team GNP," the quick-help support line for Lotus users. GNP Development Corp. is not associated with Lotus Development Corp. Lotus and 1-2-3 are trademarks of Lotus Development Corp. The 8087 coprocessor is a product of Intel.

THE SHORT REPORT BY PHIL WISWELL

Mastering Managers, Macros, and College Placement

DB/Editor/Writer

I don't know how IBM Personally Developed Software has managed so many winners, but here's yet another: *DB/Editor/Writer*, a flexible record-keeping and report-writing program for personal and small business use. The program includes sample databases for managing a checking account, mail/phone directories, mail merge, billing/pricing, expense accounts, and bowling team records and averages.

Each record can use up to 32 fields and 500 characters. With 256K you can squeeze nearly 2,000 records onto one database; with 640K you can have 7,500 records. Fields can be searched/sorted using logical and Boolean operators, and my tests confirmed good speed: The program sorted 2,000 records in less than a minute. The program's menu for the function keys changes as you press Alt, Shift, or Ctrl, a brilliant detail that simplifies every operation. Databases are stored as ASCII text files; thus output can be used by other programs that process text files and vice versa. *DB/Editor/Writer* can also format data to DIF format for spreadsheet use. Manipulating databases with BASIC couldn't be much easier. *DB/Editor/Writer* (IBM Personally Developed Software, P.O. Box 3280, Wallingford, CT 06494; \$49.95 plus handling; for PC, XT, AT, PCjr; requires 128K RAM, DOS 1.1 and later).

Macro-Toolkit

The use of macros in the design, redesign, and analysis of a 1-2-3 worksheet makes your work easier and less time consuming. But if you don't want to write the macros yourself, *Macro-Toolkit* offers you a good selection of one-stroke tricks that are easily implemented. Just File-Retrieve or File-Combine-Copy the toolkit you want into

DB/Editor/Writer from IBM Personally Developed Software

Macro-Toolkit from MicroRealities

your worksheet, then invoke a macro with the Alt key plus its first letter. If your worksheet makes you sweat for the data you want, maybe it's not the fault of the carpenter but of the tools. *Macro-Toolkit* (MicroRealities, Box 60123, Grand Junction, CO 81506; \$35 plus handling; for PC, XT, AT, PCjr, and compatibles; requires 128K RAM, DOS 1.1 and later).

Macro-Toolkit contains a demonstration file and four "toolkits" or templates that provide 15 handy macro functions, from printing address labels to converting formulas to values, and it has the ability to generate your own macros. Certain functions are new to 1-2-3, such as reconfiguring data from rows to columns and vice versa. Others macros automate or increase the power of existing 1-2-3 commands. For example, you can "chain" column width adjustments. Great stuff.

Below the Root

The world of *Below the Root*, rich in graphics, action, and fantasy role playing, is based on *The Green-Sky Trilogy*, a classic children's tale by Zilpha Keatley Snyder that takes place among the branches and roots of seven enormous trees where the inhabitants of Green-Sky live. You control a character who can walk, run, jump, crawl, and glide on wings through the more than 500 screens that comprise the game. Along the way you find many shrewlings, most of

them inhabited by other creatures with whom you must interact. A menu of several dozen actions like speak, take, and examine offers you many choices.

The object of *Below the Root* is to decipher an intriguing message that will save the inhabitants of Green-Sky from certain doom. But you set out knowing no more than that, and only through persistent cleverness will you begin to understand the rules of this strange world. It doesn't matter if you're 14 or 40 years old: If you're into fantasy, you'll love this game. Take a formatted data disk with you, though, because you will be a long time *Below the Root* (Windham Classics Corp., One Kendall Square, Cambridge, MA 02139; \$26.95; for PC, PCjr, and compatibles; requires 128K RAM, color/graphics).

College Directions

Summer is traditionally the best time to travel around the country shopping for a college, and preparation is the key to a successful trip. High school guidance counselors and public libraries are your main resources. Here's a very good supplement: *College Directions* (Systems Software Associates, Inc., 723 Kanawha Blvd. East, Charleston, WV 25301; \$185 plus handling; for PC, XT, AT, and compatibles; requires 128K RAM).

Basically, *College Directions* is a current database of 1,300 four-year colleges and

universities. You select criteria (tuition range, type of major, admission standards, size of school, and so forth), give them an order of importance, select five states, and wait for a print-out listing the colleges that fit your requirements along with their states and reference numbers. You can then explore particular colleges, estimate costs, and receive a very handy print-out. The program will also write a letter to the college of your choice. Packing is up to you.

Liptocoe

With so many programs vying for space in this column, I found it quite easy to leave the game *Liptocoe* untouched in my in-box for several weeks, which is too bad because *Liptocoe* is a good action game.

Liptocoe (IBM Personally Developed Software, P.O. Box 3280, Wallingford, CT 06494; \$19.95 plus handling; for PC, XT, PCjr; requires 128K RAM, color display) is a munch-your-way-out-of-the-maze game. Not quite Pac-Man, but related. Your character begins each of 50 very different levels in the center of a maze of walls, death mines, halls, rooms of edible dots, and an exit door that you can open only by eating enough dots. Of course, you're being chased the whole time by four enemies. A nifty screen editor allows you to create, store, and play up to ten original levels. Too bad it doesn't let you rewrite the title.

All of a sudden, you're an accountant!

CPA+™ menu-driven accounting software works with Lotus™ 1-2-3™ to put you in command of all your company's vital financial recordkeeping.

With a single keystroke, CPA+ lets you switch between General Ledger, Accounts Receivable, Accounts Payable, and Payroll—plus graphs and forecasts.

Instantly. Without swapping disks.

CPA+ automatically integrates and updates data between applications, and utilizes the vast spread-sheet capabilities of Lotus™ 1-2-3™.

Simply put Lotus 1-2-3 in drive A and CPA+ in B or hard disk, and you're on your way. CPA+ handles as many as 700 accounts and 48 employees, depending on your computer memory (256K to 640K).

Automatic prompting steers you through data entry. You can view, edit, and change any entry before printing. Scroll through your records—instantly. Order customized reports. See your numbers converted into charts. Then:

When you decide what to print, even an order such as "Print Checks—All" is as easy as typing PCA.

Our \$10 special offer.

Get our demo-and-interactive tutorial disk for just \$10. Call toll-free 1-800-TEAM-GNP (from California, 1-800-MEET-GNP) and give us your credit card number.

Quicker yet, try CPA+ at your software store. You'll find it's so easy to use, you'll want to buy it on the spot. Good. The suggested price of only \$695 puts CPA+ on your payroll.

All of a sudden, all you need to know to keep your company's books is one name. CPA+.

CPA+ works in synergy
with Lotus 1-2-3.

© 1984, 1985 GNP Development Corp., 1244 E. Colina Blvd., Pasadena, Ca. 91106 (818) 577-2550

1. Follow instructions on the other side

At Applied Computer Products, we've got it all—competitive prices plus support personnel second to none.

Many computer companies think of service and support as "extras"—and jack up their prices accordingly.

At Applied Computer Products, we see things differently.

We offer the PC buyer the most economical computer package available. One that includes incredibly low-priced IBM and compatible hardware, software and peripherals, the assurance of fast, reliable service, knowledgeable answers to technical questions, and expeditious, complete warranty maintenance.

Consulting . . . Problem solving is what sets us apart from the other telemarketing and direct retail companies. We don't just take orders. Our dedicated support team is available to answer any of your questions. We apply our knowledge and experience to analyze the special needs of your business in order to recommend a system of hardware and software components best suited to perform the job.

On-Time Delivery . . . We fulfill the order accurately and ship on-time! We never make promises we can't keep. So, you'll be given a realistic date for

delivery . . . usually an early date, because we stock a comprehensive inventory.

Competitive Pricing . . . Purchasing in large volume gives us an advantage, and we pass that advantage along to our customers. So, you don't have to be concerned about paying for our extraordinary service. It's the thing that gives us a competitive edge, it's our difference.

Technical Support . . . Our dedicated support team is available to answer your questions and to provide continuing service after your purchase. Installation, setup, on-site problem solving and exchange or repair service are vital parts of our customer commitment.

Warranty and Maintenance . . . We are a factory authorized maintenance center for hundreds of products including IBM. The warranty on any equipment is at least 90 days parts and labor. If you encounter any problems

just call our technical department for a prompt resolution.

These are just a few of the reasons why you should call now and learn what a difference "Applied" makes when a company stakes its name on it.

Our Policy

- VISA or MC, no surcharge.
- Pre-approved company check, certified check or COD.
- Allow time for company checks to clear.
- Volume purchase agreements available. Government, corporate and institutional PO's accepted.
- Call for shipping charges. No additional charge for split shipments.
- 90-day parts and labor warranties on all equipment; up to 5 years on many products.
- Orders subject to availability. Prices subject to change without notice.
- Returns may be subject to restocking fee.

For competitive prices, prompt service and full support call

EPSON and Applied Computer Products...

Applied Computer Products and Epson have teamed up to bring you versatile Epson FX-80+, FX-100+ and LQ-1500 printers. They're in stock right now, ready for immediate shipment to anywhere in the U.S.

Applied Computer Products backs each unit with a comprehensive support program that includes prompt, free technical assistance, a liberal return policy, and thorough pre-testing of all equipment, at no cost, before it leaves our warehouse. In addition, we offer some of the industry's lowest Epson prices and best quantity discounts.

As an authorized Epson maintenance center, we

can provide fast, quality service on any Epson printer, whether purchased here or elsewhere. And, Epson's one-year printer warranty entitles you to service at any authorized Epson maintenance center in the U.S.

**Call Applied Computer Products

Only an EPSON is an EPSON.

YOUR WINNING TEAM FOR HIGH QUALITY PRINTERS

FX 100 - Get down to better business with Epson's new wide-carriage FX 100 - printer. One-touch SelectType makes choosing typesets easy. For company forms or letterheads it prints fanfold or individual sheets 4 to 16 inches wide. The FX 100 - prints originals and three carbonics—even mixes text and graphics on the same page!

- built-in 2K buffer lets you compute as you print
- 136 columns wide for spreadsheets and ledgers
- logic-seeking electronics yield 20% faster throughput
- 160 CPS, bi-directional

FX 80 - This versatile workhorse opens up a world of printing possibilities.

Epson's SelectType feature puts over 160 character fonts with 9 different typesets and 2 utilities at your fingertips. Create up to 256 personalized characters... print charts and graphs in a choice of six densities from 60 to 240 dots per inch... even mix text and graphics on the same line. Optional single-bin cut sheet feeder and NLQ board (32 cps Roman and sans serif).

- uses single sheet or pin feed paper
- logic-seeking electronics yield 20% faster throughput
- 160 CPS, bi-directional
- 2K RAM print buffer

LQ 1500 Upgrade your office with one of Epson's best. The LQ 1500 is two in one—a high-speed draft printer and a high-quality letter printer. Its 24-pin print head produces letter quality type indistinguishable from an office typewriter at speeds almost four times that of an average daisy wheel printer. Optional tractor feed and single-bin cut sheet feeder.

- prints reports at 200 cps in draft mode, 67 cps in LQ mode
- amazingly high-resolution graphics

PARITY CHECK BY STEPHEN MANES

Learning a Hard Lesson From Borland's Turbo Tutor

I keep telling myself I'm going cold turkey. I keep saying that henceforth I will not allow a single line of code to pass my fingertips. I keep repeating that programming drains my resources, damages my psyche, and eats up my time. I keep insisting that programmers should do the programming and we users should do the using. Then I think up some new gimmick I absolutely can't do without and fall off the wagon into the evil clutches of late-night spaghetti code.

How can I help it? I can't load programs or change the colors on my screen at the touch of a button. Say I need to keep a batch file from echoing commands to the screen. Say I need a BASIC program module to change the color of text, background, and border and maintain them on returning to DOS. The only thing for it is a little programming. Easy stuff, though. Nothing to it.

Life's a Batch

Ha! The batch file works just fine on my machine, but some kind of insidious bug in other versions of DOS keeps the ECHO command from working properly. The first person who tries the batch file instantly inquires, "What's all this garbage all over my screen?" Because he vaguely remembers hearing something about the bug, it takes us only 5 minutes to dope out the problem and a mere 15 to devise a foolproof workaround.

Then I try out the color-change part of my BASIC program. Surprise! It works fine until I get back to DOS, which steals the colors back to plain vanilla-on-licorice. Since I'd gotten this kind of thing to work properly before in some pro-

gram or other somewhere on one of a hundred or so floppy disks someplace, I do the only reasonable thing under the circumstances: Phone my friend the BASIC expert.

Some peculiarity of WIDTH and other screen-control commands, it turns out, makes them very fussy about the order in which you call them. Is this documented anywhere? The expert simply snickers and guff-

Alas, *Turbo Tutor* turns out to be the one Borland product I've seen that's not much good. It's mostly a book with a disk of samples thrown in to save you typing. That's not inherently terrible: The BASIC tomes that used to come with the PCjr and Apple (and for all I know, still do) were pretty darned good. But *Turbo Tutor* doesn't include enough examples to make you really understand what's going

The only thing lower than a BASIC amateur is a tenderfingers who doesn't program at all.

faws. "That's programming," says he. "If you do it all the time, you learn where the bugs are."

Snort Retorts

I make the mistake of relating all this to a Pascal guru. "Serves you right for using BASIC and that so-called batch file 'language,'" he snorts. In the programming hierarchy, the only thing lower than a BASIC amateur is a tenderfingers who doesn't program at all.

So I investigate *Turbo Pascal*. It gets virtually unqualified raves from Pascal experts. It's cheap, it comes complete with its own full-screen *WordStar*-like editor, it compiles code fast in one pass without the need for the DOS linker, and it gives clear error messages that often take you right to the scene of the crime. It's the kind of programming environment we BASIC patzers wish we had. And Borland's instructional aid, *Turbo Tutor*, promises to take me through the mysteries step by step.

on, and many of its lessons are tied in to ancient hacker rites like the incomprehensible *Star Trek* games.

Worse, some of the examples don't run and aren't meant to. It's not the book's fault: the trouble is a feature of Pascal that real programmers love and amateurs detest. *Turbo Tutor* calls it The Great Underlying Rule of Pascal: All identifiers must be declared before they are used.

You can't just type in a Pascal subroutine and see what it does. The whole program must be thought out before a word of code gets on the screen. The very idea behind Pascal is to force you to think and program in an officially approved, structured fashion: Pascal was designed to be used as a teaching language.

Fast and Dirty

But so was BASIC, and its beauty, at least in its microcomputer versions, is that it lets you throw together a quick-and-dirty program fast. It may not be elegant, you may not care.

BASIC's syntax is a hell of a lot more intuitive than Pascal's. It does the worrying about your variables so you don't have to. And IBM's BASIC includes all sorts of highly machine-specific functions, particularly with regard to screen control, for which you may have to write a lot of code (or buy prewritten routines such as *Graphix Toolbox*) in Pascal. BASIC code isn't portable; so you wouldn't use it to develop software to run across a whole spectrum of machines, but nothing beats it if you want to turn your screen red in a hurry without spending months learning a new lingo. And the BASIC world is likely to get better: Borland plans to release a Turbo-style BASIC compiler before the end of the year.

In a sense, every application program really functions as a specialized and limited programming language that helps you get your computer to do what you want it to. Increasingly, users needn't bother with "real" programming languages at all. Two years ago I wrote a rudimentary four-function calculator in BASIC; today I use the much better one in *SideKick*. Borland includes the source code for a rudimentary spreadsheet with every copy of *Turbo Pascal*; what it teaches is that you're not likely to beat Lotus's 1-2-3 by rolling your own.

Knowing something about programming does make many things easier to use: DOS batch files, macros, and database software, to name a few. But nowadays you're not exactly out in the cold if you don't program. In fact, you may actually experience the heady feeling of getting something useful accomplished with your machine. ■

1-800-241-8149. TWO NUMBERS YOU

Locally or across the nation, you're only a phone call away from the best advice, information, sales and service for all your computer needs.

At Micro Mart. A name you can trust.

We're proud to offer the widest range of computer products anywhere. At very competitive prices. With innovative financing options like the Micro Mart Blue Chip Credit Card.

When we say a product is available today, we mean today. Our Micro-to-Mainframe inventory system keeps our products current. And our customers satisfied. We deliver quickly because we're geared to ship hundreds of products daily to customers all over the world.

But we don't stop there.

Micro Mart offers a comprehensive range of Technical Support and Customer Service after-the-sale. We're on-site with hundreds of service locations nationwide. And our National Service Center is one of the fastest depot services in the USA.

Call Micro Mart today. You'll meet people who back up price, availability and service with performance. You can count on it.

Buy A Local Area Network For Less Than \$100 Per PC

STOP buying expensive duplicate PC peripherals. Usually your peripherals just sit idle. If your office owns two or more PCs can you justify a costly printer and multiple disk drives for each PC? How often are your printers actually busy? Thirty minutes a day? An hour a day? Even your expensive hard disk is used infrequently.

The obvious solution to avoid expensive duplicate peripherals is a local area network that allows you to share printer and disk drives. But until now LANs have cost in excess of \$1,000 per PC.

INTRODUCING THE *EasyLAN*™ OFFICE NETWORK

EasyLAN shares printers and disk drives between IBM PCs. *EasyLAN* can save you \$1000 or more per PC by eliminating duplicate equipment purchases. *EasyLAN* advantages:

- *EasyLAN* shares printers, disk drives, and information
- Easy to justify—less than \$100 per PC
- Easy to install
- Easy to operate
- Easy to order
- *EasyLAN* performs in the background.

EasyLAN's low price matches the small business user's cost-sensitive budget. It is the office network solution for less than \$100 per PC including cables and software. At this price, the RISK IS LOW, and the BENEFITS ARE HIGH.

EasyLAN performs its operations concurrently in the background. *EasyLAN* communications, file transfers and printer operations all take place while each PC simultaneously performs such normal DOS applications as Lotus 1-2-3,™ WordStar™ and dBASE™.

EASY TO OPERATE

EasyLAN network software allows PC users to share printer and disk peripherals. PCs are connected by *EasyLAN* cables plugged directly into your PC's standard serial communication ports and *EasyLAN* can be used with digital PBXs. *EasyLAN* supports geographically separated PCs using modems and dial-up lines.

EasyLAN's performance meets your small office requirements to move word processing documents and spreadsheet between PCs. For example, *EasyLAN* can move a 10 page document between two PCs, as a background operation, in less than one minute!

EasyLAN loads automatically at boot time. It manages the PC's serial and parallel ports for

communications and printing. All *EasyLAN* operations may be started from any connected PC.

Printer sharing operates transparently with existing programs. Print files are automatically written to disk and scheduled for printing. Multiple printers per PC may be designated for specific office tasks.

For example, one PC can interface with Printer 1 for general purpose output, with Printer 2 for continuous-form letterhead stationery, and with Printer 3 for printing continuous-form invoices.

Disk sharing uses *EasyLAN*'s COPY command, EZCOPY™, to move files to and from PCs. Files are stored or retrieved from disk storage and the Directory is updated. The high-capacity benefits of just one hard disk can now be shared by several PCs.

All communication operations are protected by a unique password assigned to each PC so security is maintained.

EASY SPECIFICATIONS

Each PC in the network requires an individual copy of the *EasyLAN* software, 128k of memory, a serial communication port(s), and DOS 2.0 or above. For your convenience, *EasyLAN* diskettes are not copy protected. *EasyLAN* runs on all IBM PC models (PC, XT, AT, and AT) and compatible PCs.

EASY TO INSTALL

EasyLAN can be installed in less time than it takes to enjoy your coffee break. Just plug the *EasyLAN* cables into existing serial ports. *EasyLAN*'s PRINT, COPY and DIRECTORY commands are very similar to DOS commands.

EASY TO ORDER

EasyLAN is immediately available and easy to order. For a two PC network, start with the *EasyLAN* Kit. For each additional PC in the network, order the *EasyLAN* Expansion Kit.

The *EasyLAN* Kits include program diskettes, manuals and cables, which are shielded to maintain signal quality. All parts are warranted for one year. *EasyLAN* program diskettes may be purchased individually; you supply your own cables, modem links or PBX connections.

ORDER *EasyLAN* TODAY. 1-800-835-1515

Draw Your Way to the Top

*PC-Draw Will Increase Your Office Productivity.
And Upward Mobility.*

Imagine. You now have the capability to graphically depict your best ideas, plans, designs and proposals. *In color or black & white.* Accurately. Completely. Dramatically. Concepts presented so forcefully—yet so simply—that you leave that critical meeting with upper management... *totally* confident of success.

And you win. Your secret weapon? PC-Draw. A powerful interactive graphics program for the IBM PC, XT, AT, Jr.[®] or compatible—*unlike anything else* on the market. Using PC-Draw you create virtually anything that can be drawn with pencil and paper. Quickly. Easily. With far greater detail.

PC-Draw is ideal for presentation graphics, proposals,

systems design, forms, diagrams... and an endless variety of charts, graphs and illustrations. PC-Draw allows you to produce drawings *up to 99 pages* long. Several templates come with PC-Draw including Flowcharting, Electrical Design, Office Layout, and Alternate Text. In addition you create and store your *own* unlimited supply of user defined symbols.

PC-Draw includes an *easy-to-follow* interactive tutorial. Requires IBM or compatible, graphics adapter and graphics monitor (or IBM compatible monochrome graphics card). Graphic boards and light pens at excellent prices.

Shhh! Don't tell your office competition about PC-Draw. They'll catch on soon enough. To order or for free brochure call **800/2PC-DRAW**. In Texas or for customer support call 214/234-1769. Micrografx, Inc., 1820 N. Greenville Ave., Richardson, Texas 75081.

**10 DAY
TRIAL
PERIOD**

Out of the Mouths of Babes

Children's innate curiosity and self-confidence make them exceptional learners. But they also have something to teach users and programmers alike: how to ask the question, why?

Hello?"
 "Hi, Daddy!"
 "Hi, Stephanie. How are you?"

Stephanie is my 3-year-old daughter. She's never called me at work before.

"Fine, Daddy. Um, I have a question about your computer. How do I make it go in color?"

I have a Compaq Plus at home, with a Sears RGB monitor/TV set to augment the built-in 9-inch green screen. The Compaq has both color and mono modes.

"Do you have the machine on?"

"Yes."

"Find the key that says C-T-R-L on it and the one that says A-L-T. Then find the one that has a little arrow that points at the M."

"Ummm. Okay."

"Now press all three of them at the same time."

"Oh. Now it's in color. Thank you, Daddy."
 Click.

Stephanie has been using a computer ever since she could sit up straight at the keyboard. Does this mean she's a prodigy? No. Sure, she's smart, but so is everybody else's kid.

She has access and encouragement, which is all children need to fire up their incredible learning engines. She also has a small collection of favorite programs. Her first was *My Letters, Numbers, and Words* by Nighthawk Computing. It taught her the alphabet, numbers to ten, and some simple words. Even its most mundane alphabet drills hold her interest

because an occasional mouse darts across the screen or an inchworm wends its halting way.

IBM's *Bumble Games* has, if you can believe it, taught her about x-y coordinates, left and right, and magnitude.

Bill Machrone

She's also learned to read enough of its prompts so that she can select and play the games without adult intervention.

She tries her hand at straight recreational games, such as *Stryx* and *Jumpman*, but the eye-hand skills required still elude her. Her current favorite is *My ABCs* by Adam Osborne's new company, Paperback Software. This disk is a veritable cornucopia of games, drills, and fun for kids. She likes the game based on "Concentration" best.

Stephanie also gets a tremendous kick out of using the mouse in conjunction with *PC Paint*. She sketches on the screen, draws and fills shapes, uses

fonts, and generally has a ball. I walked into the den a few weeks ago to see what she had created on the screen. It looked for all the world like a Joan Miró dog.

"That's nice, Steph. Can you tell me about it?"

"It's a dog, Daddy."

"What was it going to be before you started?"

"A dog."

"You knew you were going to draw a dog?"

"Silly Daddy. Woof!"

Silly Daddy, indeed. But I'll tell you something sillier: the DOS user interface lies between us and all the learning, fun, and productivity the computer has to offer. You know just how bad it is when you explain all its little necessities to a credulous, malleable 3-year-old, and she hits you with the biggest gun in her arsenal: "Why?"

Training versus Teaching

Supposedly, teaching children is vastly different from training adults (note the difference in terminology), and confusing one with the other insults both. And yet a common ground exists between training and teaching that utterly dominates and overwhelms the professional jealousies that would have us believe that there is a difference, if not an impassable chasm: Learning. Adults learn. Children learn. Of course, you use different techniques to facilitate learning in the two groups, but when the subject is computers, the similarities are notable. Repetition and reward, for example, function identically. Granted, the rewards are dif-

What the world really needs is a 99 cent Double Sided, Double Density Diskette with a LIFETIME WARRANTY!

And DISK WORLD! has it.

**Introducing Super Star Diskettes:
the high quality diskette with
the lowest price
and the best LIFETIME WARRANTY!**

In the course of selling more than a million diskettes every month, we've learned something: higher prices don't necessarily mean higher quality.

In fact, we've found that a good diskette manufacturer simply manufactures a good diskette... no matter what they charge for it. (By way of example, consider that none of the brands that we carry has a return rate of greater than 1/1,000th of 1 percent.)

In other words, when people buy a more expensive diskette, they aren't necessarily buying higher quality. The extra money might be going toward flashier advertising, snazzier packaging or simply higher profits. But the extra money in a higher price isn't buying better quality.

All of the good manufacturers put out a good diskette. Period.

How to cut diskette prices ...without cutting quality.

Now this discovery posed a dilemma: how to cut the price of diskettes without lowering the quality.

There are about 85 companies claiming to be "diskette" manufacturers.

Trouble is, most of them aren't manufacturers. Rather, they are fabricators or marketers, taking other company's components, possibly doing one or more steps of the processing themselves and passing their labels on the finished product.

The new Eastman Kodak diskettes, for example, are one of these. So are IBM 5 1/4" diskettes. Same for OYSAN, Polaroid and many, many other familiar diskette brand names. Each of these diskettes is manufactured in whole or in part by another company!

So, we decided to act just like the big guys. That's how we would cut diskette prices without lowering the quality.

We would go out and find smaller companies to manufacture a diskette to our specifications... specifications which are higher than most... and simply create our own "name brand" diskette.

Name brand diskettes that offered high quality at low prices.

SUPER
STAR
DISKETTES

5 1/4"
SSDD
.91 ea.
Qty. 50

5 1/4"
SSDD
.99 ea.
Qty. 50

Super Star diskettes are sold in multiples of 50 only. Diskettes are shipped with white Tyvek sleeves, reinforced hubs, user I/O labels and write-protect tabs.

Boy, did we get lucky. Our Super Star Diskettes are the same ones you've been using for years...without knowing it.

In our search for the low priced, high quality diskette of our dreams, we found something even more interesting. We found that there are several manufacturers who don't give a hoot about the consumer market for their diskettes. They don't spend millions of dollars in advertising trying to get you, the computer user, to use their diskettes.

Instead, they concentrate their efforts on turning out the highest quality diskettes they can, because they sell them to the software publishers, computer manufacturers and other folks who (in turn) put their name on them... and sell them for much higher prices to you!

After all, when a software publisher or computer manufacturer or diskette marketer puts their name on a diskette, they want it to work better after time, even time in a poorly protected software publishers who have the nasty habit of copy-protecting their originals!

Super Star Diskettes. You already know how good they are. Now you can buy them...cheap.

Well, that's the story.

Super Star diskettes don't roll off the boat from Pago Pago or emerge from a basement plant just east of Nowhere.

Super Star diskettes have been around for years... and you've used them for years as copy-protected software originals, unprotected originals. Sometimes, depending on which computer you own, the system master may have been on a Super Star diskette. And maybe more than once, you've bought a box or two or more of Super Star diskettes without knowing it. They just had some "big" company's name on them.

Super Star Diskettes are good. So good that a lot of major software publishers, computer manufacturers and other diskette marketers buy them in the tens or hundreds of thousands.

We buy them in the millions.

And that's why we sell them to you cheap.

**When every little bit counts,
it's Super Star Diskettes.**

You've used them a hundred times, under different names.

Now, you can buy the real McCoy, the same diskette that major software publishers, computer manufacturers and diskette marketers buy and call their own.

We simply charge less.

Super Special!

Order 50 Super Star Diskettes and we'll be happy to sell you an Amray Media-Mate 50 for only \$8.75, shipping included... a lot less than the suggested retail price of \$15.95.

Regular DISK WORLD! price: \$9.99 ea.
+ \$2.00 Shpg.

DISKETTE STORAGE CASES

DISK CADDIES

The original flip-up holder for 10 5 1/4" diskettes. Beige or Grey only.

\$1.65 ea. + .20 Shpg.

DISKETTE 70 STORAGE

Dust-free storage for 70 5 1/4" diskettes. Six dividers included. An excellent value.

\$11.95 ea. + \$3.00 Shpg.

ferent. A child responds better to a unicorn dancing to a merry tune, but both respond equally to on-screen words of praise once the child can read. Both have limited attention spans; motivation is the

big factor in overcoming this limit.

Interestingly, children are often more motivated than adults to learn to use a computer or a specific program. It's all a matter of image. Children have many

role models, from futuristic television shows to admired adults. They learn specific programs for self-satisfaction as well as peer-group acceptance. Sure, my daughter is more interested in computers when I'm around. She exults, however, in demonstrating her proficiency to other children, as well as adults. The computer is just as important an accomplishment to her as writing her name, pouring her own orange juice, or doing a somersault.

Your hard disk has a serious problem that's ready to explode.

When you first started using a hard disk system, you thought its enormous storage capacity solved all your problems. Little did you suspect that you were gaining a new problem that's getting out of control: Disk organization.

Now that your hard disk can literally hold thousands of files, how are you going to easily find the one file you want, whose name you may have forgotten? Sort the files in some kind of logical order? Rename them or move them around?

Don't look to PC-DOS for help. In fact, you may have found it so difficult to manipulate your files with PC-DOS, you don't bother to remove the redundant or unnecessary ones. You just keep adding files to your disk and pray that it doesn't reach critical mass.

Well, help is at hand — with **KEEPTACK**, quite simply the best software system for disk organization and maintenance you can buy.

KEEPTACK's screen display lets you see your entire disk's contents at a glance. Its friendly "browse-and-mark" system lets you view, move, copy, remove, and rename files or directories without keyboarding confusing PC-DOS commands.

You can sort five ways, including alphabetically. Its search function is so fast, it can locate the file you want in less than two seconds! Even if you don't remember the file's exact name, **KEEPTACK** will find it! Full on-screen help is always a keystroke away. And all this is just a small sample of how **KEEPTACK** can solve your PC problems.

KEEPTACK even comes with a book that clearly explains the "why's and how's" of disk management. It alone is well worth the price of the entire package.

And what is the price? Just **\$79!**

KEEPTACK is not copy-protected.

VISA and MC card holders can order by calling (415) 322-6161. To order by mail, send your check for \$84 (\$5 for S&H) to: THE FINOT GROUP, 2390 El Camino Real, Suite 3, Palo Alto, CA 94306. California residents, add applicable sales tax.

For more information, contact us today.

Requirements: IBM® PC XT, AT, or COMPAG® and other

two computers with 102K under PC-DOS 2.0 or higher with 304K or 4096K hard disk, you need 256K.

IBM and COMPAG are registered trademarks of International Business Machines Corp. and COMPAG Computer Corp., respectively

A Stacked Deck

Adults in business have the deck somewhat stacked against them. They may not necessarily want the computer, and they have significantly more experience at failure. They can imagine themselves failing to learn an aspect of computer operation and construct elaborate defenses in the event that they do fail. Children, in their innocent, enormous egotism, cannot conceive of failing to learn something new, especially when it's so much fun.

Not that the industry is making it easy for children or adults. No two of Stephanie's programs start from DOS in exactly the same way. All are copy protected. None select options the same way. Some use cursor keys, while others use the space bar or require specific letters to be pressed. The child's "Why?" lays waste to all this nonsense, while adults accept, rather resignedly, that it must be this way for some good reason and that it's going to be tougher to learn as a result. After all, they've been on the receiving end of systems designed by others all their lives. Indeed, most adults have about as much curiosity concerning why a program is designed a certain way as an Airdale does of how dog food gets into cans.

Should those of us who design programs for the use of others capitalize on human nature? Should we abuse the privilege? Obviously not.

Reasonable alternatives already exist. Topview, GEM, and (soon) Windows offer the programmer opportunities to standardize the user interface.

In the meantime, if you can turn on the Compag's RGB port from a batch file, let me know how. Stephanie would be ever so grateful. ■

SOLVE PROGRAMMING PROBLEMS THE WAY YOU THINK. PURE AND SYMBOL.

APL★PLUS®/PC IS THE ANSWER.

The shortest distance between two points is a straight line. But unfortunately, that's not the case in programming.

Most languages require you to go through an enormous number of steps before an idea becomes reality.

That's why the APL★PLUS/PC System is such a dramatic and exciting software tool for serious PC programmers and application developers.

Instead of requiring you to learn—and write—long-winded and complicated programs, APL is based on your instinctive ability to deal in symbols. And once you begin using APL's quick notations, you'll find it the ideal programming

environment for all your application needs.

The incredible shortcuts you'll get with APL not only make you more productive, but make programming enjoyable. Intricate calculations and modeling on PC's are a snap. You'll spend less time on drudgery, and more time creating.

Only with APL★PLUS/PC, do you get:

- full-screen editing
- a built-in terminal emulator
- communications
- graphics primitives
- and report formatting.

Writing time-consuming programs like sorting, matrix inversions, and string searching is eliminated. APL's concise notation

already provides these...and more.

No wonder a *PC Magazine* reviewer enthusiastically reacted to our APL★PLUS/PC System with "awe and delight."

So will you. The complete package price is \$595 and major credit cards are accepted.

Act now and we'll send you a free Convincer Kit. Contact your local dealer, or call 800-592-0050 (in Maryland, call 301-984-5123) to order your system, or for more information about our other APL PLUS★WARE™ products—from our UNIX™ version to our new streamlined Pocket APL™.

You'll see how symbol they are to use, the very first time you use them.

Problem-solving at the speed of thought.

STSC
A Control Company

APL★PLUS/PC System requires 182K. A soft character set can be used for computers with IBM compatible graphics board. A character generator ROM or software is included for the IBM PC or selected compatibles.

PLUS★WARE and POCKET APL are trademarks of STSC, Inc. APL★PLUS is a registered service mark and trademark of STSC, Inc. UNIX is a trademark of AT&T Bell Laboratories.

YOU FORCED US TO MOVE!

...and We Love You
For It!

LOGICSOFT

Because of the tremendous response you've given to our FREE OVERNIGHT DELIVERY and 10 OFF policies, our growth has been phenomenal! Even we did not project how rapidly we would expand. Quite honestly there were times when it seemed like the whole country was trying to place an order...at the same time!

We realize that some of you have had problems getting through our phones simply could not handle the volume! and, yes, some have even gotten their shipments late (our shipping department has been on a 12 hour schedule)...to those of you, WE APOLOGIZE for the inconvenience and would like to say THANK YOU for your patience.

A one million dollar investment has allowed us to solve these problems...we've just moved into our new World Headquarters, beated up our sales department, added a spanking new phone system and built a fully automated warehouse.

Oh, sorry, we almost forgot "Harold" (who's extremely fast, but very sensitive) our new 100 terminal computer system. He's designed to speed up order processing to get your shipments out the door...fast. Sorry Harold.

ANNOUNCING DATA DECISIONS PC COMMUNICATIONS

The first and only information service that TESTS and EVALUATES all the hardware and software products you need to link your pc's to corporate mainframes, minis, data services and other pc's.

Looking for a micro-to-mainframe link? PC COMMUNICATIONS includes everything from terminal emulation...to file transfer and data conversion...to software products that connect pc's directly to mainframe databases.

Looking at LANs? We test them with single and multiple users...with different kinds of users...with different types of software.

Want to connect your pc's to online databases—or to each other? Live hands-on test results for all the products you need to know about are here.

Your One-Stop Look-Up Source

Whatever products you need, we cover them all...we test them all...and we give you independent expert evaluations you can trust. And product information is just the beginning!

Analysis of Emerging Trends

The same experts who evaluate these products also spot emerging trends. They tell you where the new micro communications technologies are going and how they work.... They also tell you what will matter in the long run—and what won't. And because you'll know what your options are at the earliest possible

date, you won't have to worry that decisions made today will shut you off from future products and technologies.

What You Get

PC COMMUNICATIONS comes to you in 3 loose-leaf volumes which are updated every month to ensure their currentness and completeness.

In them you'll find the results of hundreds of hands-on tests done under consistent, controlled laboratory conditions by our specially trained team of micro communications experts—experts who will tell you what each product's strengths and limitations are...how competing products compare...and what you can expect when you interconnect different products and

turn them on.

You'll also get easy-to-read rating charts that show how suitable major products are for novice, experienced nontechnical and technical users...action oriented technology reports that help you set guidelines and spot trends...concise product profiles on asynchronous communication software, network services, LANs, PBXs, online services, voice/data workstations, pc-to-mainframe products, security products, and more...reliable user ratings...monthly newsletters...a com-

prehensive vendor directory for the U.S. and Canada...Unlimited free telephone consulting by experienced, informed experts, primed and waiting to hear from you—and ready to track down exactly the information you need.

A 1-year subscription to PC COMMUNICATIONS costs only \$800. You get all this information and analysis for less than it would cost you to hire a consultant to test just one product!

But don't take our word for it...

See for Yourself!

Fill in the coupon—or, better yet, phone 609/429-7100—and find out how you can receive PC COMMUNICATIONS for a no-purchase-obligation trial review.

AND

TAPE IT EASY.

Boy, are you in for a surprise. You know you need mass storage. And you know you need some kind of backup.

But what you don't know is that making a backup from your hard disk can take the patience of a saint. And tax the memory of an elephant.

Unless, of course, you have a little TLC. The new TrimLine Combo from Corvus. You get mass storage (20 Mbytes). The incredible speed and efficiency of a hard disk. And an integral tape backup.

But there the similarity between a Corvus and anything else ends.

First of all, your TLC fits in beautifully. Between your IBM PC's monitor and base. No bulky boxes. And no clumsy cables and wires to trip over.

Next, you get the world's easiest tape

backup system. If you like using command lines, fine. The TLC will accommodate you. But if you're more interested in simplicity, just use one of the TLC's menus. And one of your fingers.

You can back up the entire disk. All your data for the day. A group of selected files. Or just one single file. As a matter of fact, you can back up whatever you want. Which will save you quite a bit of time and aggravation.

You'll also find backed up files in seconds with the TLC's Directory. No more searching an entire tape just to find one file.

Finally, you'll enjoy the backup speed of the TLC. There's no formatting of blank tapes (which can save you about two hours). And no worry about losing data to bad sectors the format has called good.

Scared? Don't be. Just tape it easy. Check out the TrimLine Combo from Corvus.

In addition to all the features, it's one of the lowest-priced tape backup systems you can find.

For more information and the name of your nearest Corvus TLC dealer, call (800-4-CORVUS).

Letters to PC

Driving Differences

Winn Rosch's review of half height floppy disk drives confused me ("Double Your Driving Pleasure," PC, Volume 4 Number 10). I use a QUME Qumetrak 142A and a pair of Shugart SA-455's, and none of the drives are exactly as he describes.

In the case of the Panasonic Shugart, the disk inserts and releases exactly as he says the CDC 9428 does. If he considers this feature worth mentioning for the CDC, and I think it is, then he should have also mentioned it for the Panasonic.

On the other hand, my QUME, albeit an earlier model, differs significantly from Rosch's description. It has no head interlock, so that you are perfectly free to crash the heads into each other if there is no disk in the drive. Rosch says the head-positioning motor is "buzzy but not unusually so." With mine, each track change makes a clunk that can be heard across the room. Indexing produces a grinding noise that makes me believe it is about to fly apart any second. It has given me good service, but the noise has scared me many times.

Both models arrived without any manuals, mounting instructions, or warranty information. The Shugarts came with a mounting kit but had no instructions for it, and the kit only mounted one drive on top of the other. I was completely on my own when it came time to fasten them into my PC. They are great drives, but they are murder to install.

I wonder if the CDC and TEAC drives are as poorly documented as the Panasonic and QUME drives. This information would have been helpful in Rosch's review.

Mike Donehoo
Marietta, Georgia

Winn Rosch replies:

My product descriptions are accurate for the disk drives I actually received and tested. PC bought them on the retail mar-

ket at the time I wrote the story. Manufacturers can, and often do, make alterations to products, either to fix flaws or reduce costs.

In the sidebar that accompanied the article, I tried to warn readers of the difficulties they might encounter in buying

raw drives. Although you are apt to get nothing more than the drive itself when you buy a floppy drive at a rock-bottom price from a wholesaler or OEM supplier, reputable retail dealers offer mounting kits and installation instructions.

Thoughts on Backups

I'm not sure if Winn Rosch has enough respect for Murphy's Law to be trusted with a computer, much less with writing an article about file backup. His article "A Pair of Winchesters Beats One Streaming Tape" in PC News (PC, Volume 4 Number 10, page 69) was very convincing in many respects, but I am simply too firm a believer in Murphy's Law to accept it entirely.

The gaping hole in the logic of his article is that he fails to acknowledge that whatever can kill one hard disk can also kill two. Besides, the possibility of a major disaster, such as a fire, destroying the entire PC along with all the important files on both hard drives, there is also the risk of the backup drive failing while the other one is out for repair.

The article briefly mentions that "Tapes do have several advantages Tapes are removable and transportable." Yet, the fact that "you can keep several

backup copies on separate tapes" is not nearly as important as the fact that you can keep several copies in several places. Of course, using "a little creativity," I can buy three hard disk drives and put them on a three-day rotation, keeping one in a location away from my computer. However, this sounds like a backup system that may break down in a hurry.

Also, I was surprised to find that Rosch wrote the article "An Up-Front Approach to Backup" that states, "High on the list of abominations blamed on IBM is the marketing of personal computers with 10- and 20-megabyte hard disks without an adequate means of backup." IBM probably expects everyone to do what Rosch suggests—buy two of everything (two ATs, two XT's, and so on). Then you simply put a serial port in each machine, cable them together, and presto, fairly fast backup.

Ethan Lanz
Lafayette, Indiana

Winn Rosch replies:

The biggest problem with backup systems is that the hardware is not used. A backup system that is more likely to be used (one that's faster or easier) is often the better one.

The point of my column was not to say that double disks are the best backup system for everyone but rather to show an alternative backup idea to computer users—and perhaps jar closed-minded or backward users into rethinking and reevaluating traditional backup technologies and strategies.

Incidentally, Murphy's Law is not really a law of Nature as Lanz believes but a joke written by an inventive soul to get a few laughs. Accepting it as truth means, in essence, that you did not prepare as thoroughly as you might have.

Customer must deal with the manufacturer directly in the case of any false claims made by the manufacturer. All goods are shipped U.P.S. and Add 2% of price.

LETTERS TO PC

graphics software issue ("Business Graphics: Giving Power to Presentations," *PC*, Volume 4 Number 12). The review was straightforward and right on target. I would like to clarify one minor technical point: In the section on sources of data input, *GrafTalk* was listed as ac-

cepting data only from the keyboard. *GrafTalk* also accepts data files created in any ASCII format, including such popular programs as *WordStar*, *1-2-3*, *dBASE III*, and its own built-in editor.

UNDEL with DOS 3.x

I recently downloaded Steve Holzner's UNDEL program from the *PC Magazine* PC-IRS bulletin board ("Recovering Lost Files," *PC*, Volume 4 Number 7). Although the program will undelete a file with DOS 2.x, I was unable to make the /A option work. I tried entering the command and the /A in different combinations, for example UNDEL/A file, UNDEL/A file or UNDEL file/A, but to no avail. I would appreciate it if you would please explain what I am doing wrong.

Also, will the program work with DOS 3.0? I thought the FAT structure had been changed. I tried using UNDEL with DOS 3.0 and it seemed to work, with the exception of the problem with the /A option.

I especially like the Programming column in *PC*, and the new Interactive Reader Service makes programming even more convenient. I suspect that *PC* gets substantial feedback on this column, so how about publishing some of the user suggestions and modifications as well as follow-up comments and corrections. Also, would it be possible for you to

FASTBREAK™

8087 SPEED for LOTUS 1-2-3™

FASTBREAK speeds up 1-2-3 recalculations by up to 36 to 1 on a 4.77 MHz PC and by 79 to 1 on a NUMBER SMASHER equipped PC. It extends DOS functionality to include the 8087 and comes with a daughterboard which fits into the 8087 socket, an 8087, a break button and the necessary software. A number of additional features are invoked through its novel break button. These enable the user to lock out the keyboard, exchange information with programs written in BASIC, FORTRAN or C that are running concurrently, spool LOTUS output to a printer and install a single protected copy of 1-2-3 and FASTBREAK on your hard disk. An optional LOCK BOX makes it possible to RESET your PC and remove the break button from the computer. \$339 LOCK BOX \$60

NUMBER SMASHER™

THE FASTEST
ACCELERATOR CARD AVAILABLE!
Runs ALL your software at 9.54 MHz
512K RAM expandable to 640K

The NUMBER SMASHER includes a matched 8086-1 and 8087-1. It executes most programs a factor of 3 faster, including 8087 applications. Examples of programs that show dramatic improvements in speed include 1-2-3, AUTOCAD and any application written with MS, IBM or INTEL FORTRAN. When combined with FASTBREAK, speed improvements up to 79 to 1 have been obtained! The card occupies one slot in your I/O channel and includes a special 8087 and 512K bytes of RAM. \$1590

The Soft Solution to
AT and XT Bad Sector Problems.

Dfixer is the first production quality hard disk verification tool available to the PC user. It employs extremely sensitive algorithms to detect bad sectors and then maps them out of the MS-DOS file allocation table. It does not map out bad sectors in active files, but can be used to detect their presence. When a bad sector is detected on a file, the user copies the suspect file to new media, erases the old file and then runs Dfixer to map out the bad sector \$149

**The World Leader
in 8087 Support!**

Most project managers want just 3 little things from their software: Control, control, control.

If you're a project manager, we know what you face every day.

We're project managers too. And we created our Project Planner software to provide comprehensive support for managers who run all kinds of projects... in engineered construction, aerospace, defense, new product development, data processing, plant maintenance and more.

PRIMAVERA Project Planner™ and Primavision™ Plotter graphics give you sophisticated scheduling capabilities for up to 10,000 activities, resource leveling, cost control, custom reporting, bar charts—the works.

PRIMAVERA PROJECT PLANNER

It's the most project management you can get from a micro.

System Requirements: IBM-PC/XT, PC/AT (512k) or compatibles.

make your programs compatible with
DOS 2.x and DOS 3.x?

Drew A. Copeland
Agoura, California

Steve Holzner replies:

If you test UNDEL on a file with 1024 bytes or less (taking up one cluster on the disk), UNDEL knows exactly where that cluster is and doesn't print it out for confirmation. If you use longer files under the DOS 2.x, the /A option certainly should work (and I use it all the time). UNDEL also works with DOS 3.x as long as you are using standard, low-density disks. DOS 3.x uses a different FAT only for the new high-density (1.2-megabyte) disks and hard disks. DOS 3.x also reads switches differently, so the one thing that won't work is (you guessed it) the /A option.

I'm all for follow-up comments and modifications on programming columns and would like to hear from readers.

A Vacationing BBS

I am very pleased that my BBS, The Pigsty, made it to your recent list of bulletin board systems ("Across the Boards," PC, Volume 4 Number 12). Unfortunately, your article probably reached the newsstands and user's mailboxes just before I went on vacation and shut the bulletin board down. But now my vacation is over, and the bulletin board is up and running again, 24 hours a day.

The PC Magazine PC-IRS is a valuable service. Are you sure you won't reconsider copyrighting everything in your download area? To me, copyrighting defeats the whole purpose of a BBS.

Richard Marlowe
Winter Park, Florida

The program listings on PC-IRS are copyrighted simply because they appeared in PC Magazine. Not protecting our copyright would undermine our rights and those of our authors. PC-IRS is free of charge, which is more than you can say for some other magazines' offerings.—Ed.

CIRCLE 268 ON READER SERVICE CARD

Creative cursor control.

NoBlink / Accelerator™

A key stroke initiated at any time pops up a window containing a wide range of NoBlink™ cursors and cursor speeds to choose from, including the standard blinking cursor or standard cursor movement speed.

The NoBlink™ cursors reduce eye fatigue and eliminates the distraction of a blinking cursor.

Choosing a faster cursor speed will surprise you. It's a great time saver because it lets you move faster within your word processor or spreadsheet.

Like the blinking cursor, NoBlink™ is disabled in graphic modes. (For the IBM PC/XT/AT/3270/Jr. and true compatibles like Compaq and AT&T 6300.)

LETTERS TO PC

file, I noticed the new designation for the magazine's spine is a short name for that issue's cover package. This is a good idea, which reminds me that there is always room for a more meaningful filing system. But does it mean that as a PC subscriber, I get free updates for the spines of my back issues?

Jim Anderson
Wayne, Pennsylvania

Black-and-White Screen Dumps

Thank you for mentioning our *Print Screen* software package in PC News ("Picks and Pans on Disk Deals," PC, Volume 4 Number 11, page 60). *Print Screen* does print in black and white, but it does not, in its current version, print in color. Instead, it prints color graphics screens using various gray patterns to represent each color.

Since your review, we have tested *Print Screen* on several dot matrix printers, all with excellent results.

Gilles Mousseau
Domus Software, Ltd.
Ottawa, Ontario, Canada

Correction:

In the BASIC listing for Steven Holznar's "Watching for Disk Errors," (PC, Volume 4 Number 12), line 90 on page 273 should read

90 FOR N = 1 TO 194

With this correction, the resulting command file (313 bytes) will no longer result in a divide overflow error or a hung computer. Our apologies. There are no problems with the DSKWATCH.ASM listing, and you can download all files from our PC-IRS bulletin board at (212) 696-0360.

How to Write to PC

Do you have a comment, compliment, or criticism about something you've read in PC? A question you'd like to open up to other readers? Send it to Letters to PC, PC Magazine, One Park Avenue, New York, NY 10016. We are not able to answer letters personally.

All letters become the property of PC Magazine and may be subject to editing. We cannot print letters that do not include a name and an address.

If you bought Sideways,™ it's time to upgrade.

To Printer Boss.™

Printing spreadsheets sideways is one of the handiest software tricks to come out of the PC revolution. And Sideways™ is a nice little program. But...

Sideways doesn't support pathnames, and doesn't let you design your own sideways character font, and doesn't let you store an unlimited number of menu settings, and doesn't let you call menu settings from a command line or batch file, and doesn't give you typewriter output mode. And Brand X doesn't either.

Printer Boss does give you all of these things, plus almost everything else you could ever want in printer utility software for the dot-matrix printer, including two letter quality print modes (see chart). And it's all controlled from a plain-English menu, with a few key-strokes, and all controllable via command line from an autoexec. bat file.

And Sideline™ is for those who want sideways printing only, at a special price of \$59.95. It includes sideways printing, sideways font design, typewriter mode, command line input, menu settings storage and much more.

Don't settle for less. If you bought Sideways, or Brand X, it's time to upgrade. To Printer Boss Or Sideline. From Connecticut Software. For the IBM-PC, PC, XT, AT, and compatibles, 128K RAM, one double-sided drive and PC-DOS 2.0, 2.1, 3.0. Runs on all Epson and IBM dot-matrix printers and all compatibles. Printer Boss \$139.95, unprotected backup \$29.95. Sideline unprotected \$59.95. Shipping \$4.00 each, outside USA \$15.00. COD add \$2.00. USA only. VISA, MC, money order or check. Purchase orders accepted. Dealers welcome. Free info.

Connecticut Software

With Network Revelation,[®] you're not alone.

Span the void that separates you from other PC's. Be as one with a universe of data. Be a true network with Network Revelation[®].

Network Revelation is more than a relational database management system. It's a complete applications environment for most microcomputer networks. That's not dreaming about the future. It's low-key raving about a capability of the present.

With Network Revelation, you can send and receive data on local area networks and remote file servers. Rev's data dictionaries let you add or restruct-

ture fields at will, saving ages of programming time. And our menu-driven applications generator and procedural language are eons ahead of other databases.

The possibilities are infinite. Distributed processing systems linking worlds. Accounting, inventory and order entry systems connected for instant access to data by a galaxy of users. And your data is secure with complete file or record locking.

Revelation co-exists with MS-DOS[™]. So you can transport Lotus 1-2-3[™] Multiplan[®] or other data from

PC to PC—using IBM[®]'s new PC Network or any network hardware running Novell NetWare[™]. You can even evolve files from primitive, single-user databases into a powerful Rev application.

Encounter the future of distributed data processing today. Revelation costs just \$950*. Network Revelation starts at only \$1,495* for a complete four-user system. So call us and we'll arrange for an unforgettable demonstration with a Cosmos rep in your area.

MS[™] and Multiplan[®] of Microsoft Corporation.
1-2-3[™] of Lotus Development Corporation.
NetWare[™] of Novell, Inc. IBM[®] of International Business Machines.

Striving for Practical Perfection

Everybody wants to have the perfect PC system, but nobody wants to pay for it. In the first of two articles, Norton shows you that in some cases being penny-wise can be foolish.

Although all of us would love to have Ye Perfekt PC Systeme that is ideal for our needs, not many can realistically contemplate getting one because practical constraints, like money, usually stand in the way. But, when you think about it, more and more of us use PCs heavily in our professions, and it makes good sense to have the best working tools possible. It's quite easy to pinch pennies on your PC set-ups, but if you're talking about tools that you use heavily in your jobs, your penny pinching can turn out to be a pound-foolish solution.

I'm not talking about a gold-plated PC. I'm just not interested in a spare-no-expense, ultimate computer (see "The Ultimate PC," *PC Volume 2 Number 2*). I want to discuss how to construct the best possible PC as a working tool, without throwing money away.

It's amazing, when you stop to think about it, how often you cheat yourself by getting less than you really need in the name of ill-thought-out economy. I pound away on a PC more than full-time, and there are things that I've needed for my working systems that I haven't gotten, just out of pure cheapness.

So I started upgrading my systems. In this column and the next, I want to tell you the conclusions that I've reached about putting together a super system. I'll discuss hardware in this column and go on to software in the next issue.

What's in the Box

Obviously, you start with the box itself. Which PC model? The obvious choice is an IBM AT; but to my mind, a

clear alternative is the new Compaq Deskpro 286. If you have a bias for Blue, then go AT. But for reasons that you'll see in a moment, the Deskpro 286 is a better move.

The first thing to do with an AT is to

Peter Norton

put a faster crystal in it, supercharging it up to a $\frac{1}{2}$ faster speed, unless you want to use the 287 math coprocessor (apparently the 287 doesn't get along well with a faster crystal in the AT). The Deskpro 286 features the faster crystal installed, which you can turn on or off at will.

Next, you should load up your machine with a reasonable amount of memory and I/O ports using AST's Advantage! board or Tecmar's Maestro board; avoid using IBM's memory boards (see *PC, Volume 4 Number 7*, p. 105). For the moment, forget about loading up your AT or Deskpro 286 with extended memory or bank-switched memory; just

take it up to 640K. But with the AST and Tecmar boards, you can move up to extended memory when you need it.

Get a 32-megabyte hard disk and forget about a second floppy drive or a second hard disk.

Then, for God's sake, get a tape backup unit—The Maynard Maynstream, the Tecmar tape unit, or the tape unit that's built into the Deskpro 286 (the Compaq is looking better every minute).

Taping It Seriously

Not enough PC users take tape backups seriously, but you should. Backing up a hard disk onto floppies is such a nuisance that almost no one does it as often as necessary. This procrastination is an invitation to disaster, as many of us can painfully testify. Another downfall of disk backup is that DOS's BACKUP and RESTORE programs have some awful bugs in them. I discovered the bugs in DOS 2.1 the one time I had to restore something. Unless you have hours to tend to your machine while backing up, or you really like patching the disk in hex, you should treat yourself to a tape backup unit.

If you use a PC for your work, you're crazy not to have a tape backup unit in place; end of lecture.

All that was the easy part. Now for some less-obvious stuff.

Stay Off Color

Display screens? Forget color. Get the IBM monochrome monitor and hook it up to a Hercules graphics card. You'll have the clearest possible text display

We've got hardware & software

PC Magazine Aug 8, Submitted June 5, 1985

combined with the most widely supported graphics capability. If you've really got to have color, get an IBM Enhanced Graphics Adapter without the extra memory and an IBM Enhanced Color

Display. However, my feeling is that grown-ups don't need color pictures.

The key step is to put a quarter-polarized glare filter on your screen. Don't, for heaven's sake, do without a glare fil-

ter, and don't get one of those cheapies. We're talking about saving your eyesight, so get the best; they're under a hundred bucks.

Another thing to get for your display screen is a tilt-and-swivel stand on which to perch it. IBM's is OK, but MicroComputer Accessories Inc. in Culver City, California makes a better one.

Most people overlook getting the glare screen and the tilt-and-swivel for their PCs. Don't go to work without them.

The most-important things you can get in a printer are true letter quality and true quiet.

Slower Is Better

I suppose 2400-baud modems are the latest hot thing, so you might as well get one. Then you can wait a few years for your communications service to support 2400 baud and wait a few decades more for the quality of the phone lines to catch up. On the other hand, 1200 baud might make more sense. In either case, get a Hayes, and get an internal modem to avoid cluttering up your desk with more equipment.

Choosing a printer is always a tough decision, but to my mind, you have two clear choices. The most-important things you can get in a printer are true letter quality and true quiet. (If you aren't making your whole system not only as easy on the eyes as possible, but as easy on the ears as possible, you're more of a masochist than you think you are.)

The two printers to consider are the IBM Quietwriter and the Hewlett-Packard Laserjet. The IBM printer is more versatile in the ordinary sense—it handles tractor-fed forms, and so forth. The H-P Laserjet gives you even better letter quality and a wider choice of type sizes and fonts. For good reason, H-P has been running ads with the headline "Set Your Laser on Stun"—the Laserjet printer is truly stunning, if somewhat pricey. Don't consider any other laser printer, though. There may be better ones, but the H-P is the most practical and the most widely supported.

"We will match any mail order price in this issue."

We'll support, service and warranty everything we sell and stand behind it 100%. We won't charge you for shipping or handling, nor will we penalize you for using a credit card.

William F. Gollan
President, BCP

Although I began this essay by saying that I didn't want a "gold-plated" PC, there's one piece of gold-plating that I would love to have, and that's the very pricey and very impressive Apple laser printer. If you want the ultimate in computer printers, the Apple laser will deliver it to you. But judging from some correspondence I've received lately that was printed on the Hewlett-Packard Laserjet, the H-P is super enough for most.

Laying out the cash for a laser

The MicroManager System makes your PC look more professional; soon it'll be in all the stores.

printer—about \$2,500 for the H-P if you can get a good discount—may be out of the question for personal PCs, but it is fairly reasonable for business use. If your business is paying for any kind of typesetting, chances are good that you could do it yourselves, in-house, with a PC and a laser printer. In pure dollars saved, the Laserjet may well pay for itself; when you consider the time saved, the ability to do last-minute in-house typesetting, and so forth, a laser printer might become an essential expense.

Keeping It Under Cover

Accessories are a somewhat dull but important part of your PC hardware that deserves more mention. MicroComputer Accessories Inc. is king of the heap in making these little goodies for the PC, including dust covers, rolltop diskette files, and the tilt-and-swivel platform that I mentioned before. Its latest product, The MicroManager System, is my favorite. It's a modular set of stacking stands that can hold a PC, a printer, paper, and more. It doesn't sound very exciting, but, in fact, it's a very tidy solution to a messy problem: where to put the PC and how to stash the tangle of cables (they tuck neatly inside these modules). The modular construction, the attractive design, the excellent way it stows cables, and the castor wheels on the bottom make it a darned good way to get your PC off your desk. In too many offices, PC-clut-

ter is making the place look like a boiler room. The MicroManager System makes your PC look more professional. For now, you'll find it in some mail-order computer supply catalogs, but soon it'll

be in all the stores. If you don't want to be a PC-slob, you'll get one.

In the next issue, I'll face the messier question of software for Ye Perfekt Systeme. ■

A BETTER WAY TO...

DRAW, POINT, SELECT & POSITION

For graphics, and menu selection – for direct interaction with your computer – nothing beats a light pen. It's fast. It's natural. And unlike a mouse, it won't fight with you for desk space.

Over 7500 FTG light pens are in use world-wide – they're the undisputed standard for the IBM PC.

Software is available for graphics, education, 3278 emulation, and much more. Plus, our MOUSETRAP™ is the link to most programs that can use a mouse. And, if you do any programming, you'll find it easy to add light pen support to your own creations.

For added versatility, check out our new PXL-350 HI-RES LIGHT PEN BOARD. It's fully supported by the DR. HALO II™ graphics program.

The pen is \$195. The board is \$149 with single-pixel and TopView™ interface software. We back both with a 30-day no-risk trial privilege and a two-year limited warranty.

Call today to try them, or for more information.

We've brought software development costs back down to earth...with our DSO and PCEO software packages.

Run Intel Software on your IBM PC

Development System Offering (DSO)

For \$500 this package lets your PC become a powerful software development station and includes not only PCEO but the following development software

1. **RTCS/UDI™**, The de facto standard universal development interface for the IBM PC.
2. A sophisticated upload/download communications link between your PC and any Intel development system.
3. Target system debugger with PC program loader and firmware monitor

Personal Computer Engineering Offering (PCEO)

This package includes the popular Intel Utilities which consists of

1. Assembler for 88/86/186
2. Linker
3. Locator
4. Library Manager
5. Cross reference generator
6. Object to hex converter

RTCS offers a complete line of software development packages and operating systems, Intel languages editors, real-time operating systems and high level software/hardware debuggers.

CIRCLE 394 ON READER SERVICE CARD

THE ENCYCLOPEDIA OF INFORMATION FOR YOUR IBM PC

Taken one issue at a time, *PC* is the best source of up-to-date news and information about the IBM PC you can find anywhere.

But collect a few, and suddenly you realize that you've assembled a comprehensive reference work covering every significant new IBM PC application, product and development. An encyclopedia that is updated every two weeks.

Each volume of *PC* contributes the latest information on a wide variety of subjects including:

- **New Products** What's the latest in printers, word processing software and database managers? And what's best for your needs? Everything you need to know is in *PC*'s special reports and product reviews.

- **New Applications** Need to design a graphics presentation? Communicate with other PCs? Access a database? Find out how in *PC*'s expertly written articles.

- **New Developments** How are successful professionals and companies using their PCs? Find out in *PC*'s "Pro Columns" and use their proven techniques to move ahead in your own career.

Subscribe to *PC* today. Build your own IBM PC reference library volume by volume at these special savings:

24 bi-weekly issues for only \$21.97.

COVER STORY

BILL MACHRONE

IN PRAISE OF UNSUNG HEROES

In an industry that is all too fraught with financial and marketing back-patting, PC Magazine takes time out to honor the often-overlooked people behind the technology.

Every industry has its quiet superstars. In the personal computing industry, the few have influenced the many, time after time. It is an industry in which personal endeavor, creativity, and inspiration can cause products to rise to startling levels of excellence.

Technical excellence goes beyond

mere sales performance. In one case, excellence may be an algorithm that makes a product breathtakingly fast. In another product, it may be a breakthrough in ease of use. It might be a hardware design that opens new vistas for software designers and users alike.

In nearly every case, there is an individ-

Photograph: Shig Hada

ual or a small team at the heart of an outstanding product; a person who makes sacrifices for a vision. These are the unsung heroes, the creators of technical excellence. Their accomplishments, however,

are often lost in the marketing hype and consumers' devotion to the best-seller lists.

PC Magazine's editors decided the time had come to recognize these unsung

heroes and the excellence embodied in their work. Deciding who would receive the awards was difficult yet straightforward. We assembled an editorial board, then gathered nominations for the products

The majestic grounds of Atlanta's Swan House were the perfect setting for the presentation of the awards.

THE HOTTEST TICKET IN TOWN

PC Society Editor Paul Somerson filed this report from the field—and what a field it was.

Prizers in the micro business generally don't mean much; they're usually dispensed by swaggering computer moguls to the same few vendors year after year purely as a tribute to clawing out a high-altitude perch on someone's best-seller list. While occasional winning products are of first-water quality, the process often ends up spotlighting fat marketing budgets rather than technical prowess.

Most awards are just frail brass plates stuck to veneered boards, handed out in stuffy auditoriums between stultifying, self-serving speeches that drone on too long. And the suspense is rarely killing. Will Mitch Kapor himself be there to receive the prize—or will it be picked up by one of his lieutenants? People in the audience don't exactly chew their nails down to nubs while waiting to find out.

PC Magazine wanted to do things right. We felt the people who genuinely deserved recognition were the folks in the back rooms who sweated around the clock for years in front of their computers so you wouldn't have to in front of yours—the real unsung heroes of the trade. And we wanted to hand them a work of art rather than a framed piece of paper or a plywood plaque.

After an extensive search, editor Bill Machrone commissioned an old-world craftsman to create and produce six massive solid silver medals. Painstakingly hand-carved, hand-cast, and hand-finished, these dense, jewel-like cartwheels elicit appreciative sighs and soft whistles whenever they are slipped out of their plush velvet bags.

Rather than present the medallions in a dusty hall, *PC Magazine* arranged for a truly appropriate setting: a gracious Southern manse called Swan House, set on 22 acres of lush Atlanta woodland. Dominating a hilltop with sweeping panoramic vistas of pin oak, Georgia pine, and purple bougainvillea, Swan House—modeled after a sixteenth-century Italian villa—is the embodiment of classic elegance and urbanity.

The estate's original owner, son of an immensely prosperous cotton broker, had inherited a bundle that he and his wife spent picking up eclectic furnishings and pricey antiques—from a clay T'ang dynasty horse, to a Dutch tall case clock that clangs out seven different hymns, to a Venetian table whose base is a cringing carved blackamoor with gilded feral eyes. A central swooping lacework staircase slices down to stately Ionic columns and a

that had made the most significant technical contributions to the industry in 1984. We refined our judgments, and consulted with industry experts. Here are the winners and the products they created.

Robert Carr: Framework

Framework is one man's idea of how integrated software should work. Fortunately, many people agree with Rob Carr's conception. From the time we first saw the

prototype FRED, to the press unveiling in New York, to its triumph in *PC Magazine's* Spreadsheet Face-off, *Framework* has been a winner. Its combination of speed, innovative user interface, and flexi-

Master of ceremonies Bill Machrone.

The view from the podium.

The winners pose with their awards.

burnished marble floor. Exquisite porcelain vases and precious objets d'art crowd every flat surface.

Behind the house a series of sumptuously landscaped terraces and fountains cascades into the vanishing point; inspired by the gardens of the Palazzo Corsini in Rome, this majestic verdure was the perfect backdrop for a festive evening of conviviality and bonhomie under the stars. Although more than a dozen social events had been scheduled by other COMDEX exhibitors the same night, it was evident to all that the cream of the computer industry was present in the dusky, perfumed garden.

While top computer brass rubbed elbows with the many merchandizing celebrities, legendary technical wizards, and financial luminaries in attendance, the flower of the international computer elite sipped champagne and nibbled on delicate canapés of caviar, buttery Gulf shrimp, and Pernod-scented escargot. Nearby jazz musicians provided a haunting counterpoint in the soft repuscular light. *PC Magazine* editors and advertising executives in white tie kept the conversation flowing smartly; other elegantly coiffed staffers in sequined formal gowns and filmy chiffon evening dresses provided a full measure of southern hospitality and charm.

The actual presentation was warm and uniformly well-received. Bill Machrone stole the show with colorful introductions he had rehearsed several nights before while waiting for his wife

to give birth to their new son. The air was thick with electricity as the first recipients mounted the staircase to accept their medals. At the foot of the steps the audience seemed gratified by the selection and the tenor of the ceremony; its applause was generous and heartfelt. Some of the winners simply grinned ear-to-ear as they hefted the gleaming silver trophy. Others offered eloquent thanks to valued colleagues and their hosts. Borland's Philippe Kahn toasted Pascal inventor Nikolas Wirth. Jim Slager, codeveloper with Eugene Hill of Intel's highly praised 80286 CPU, puckishly opened his coat and unfurled a blueprint of the next generation 80386 chip. Jeff Garbers, creator of Microstuf's *Infoscope*, peered down from the lofty balcony and quipped, "I feel as though I should be announcing the overthrow of a government." Both Robert Carr, chief architect of *Framework*, and *Enable's* Robert Hamilton were characteristically modest. This was the second time *PC Magazine* had recognized Carr; earlier in the year *Framework* took top honors in *PC's* Spreadsheet Face-off.

After Bill handed the final award to personal computer pioneer Henry Kee, the winners and guests strolled across the broad manicured lawn to waiting tables crowded with silver hamper of smoked baby Georgia quail, shimmering whole poached salmon, truffles, fragrant flaky tarts, and other local specialties. Winning, dining, and serene camaraderie continued late into the night. —Paul Somerson

UNSUNG HEROES

bility has set an almost insurmountable standard for integrated software. While the marketers would have us believe that FRED stands for "Freely extensible Recursive Development language," Carr says that it just stands for "Frame Editor." Such elegant understatement is the mark of the man and his product.

Philippe Kahn: Turbo Pascal

Turbo Pascal has singlehandedly turned Pascal into the language of the future. Some say that it has even rescued Pascal from oblivion. Everyone recognizes the sheer innovation, speed, size, and efficiency of Turbo Pascal, which has become a model for compiler designers everywhere; hundreds of thousands of users eagerly await the next round of Turbo products. In a market where slow-running products have become the norm, developer Philippe Kahn has restored pride in tight code to the PC programmer.

Eugene Hill and Jim Slager: The Intel 80286

The 80286 is arguably Intel's first processor that is not directly descended from the early calculator chips. It breaks through hardware and software barriers and has created a new standard in personal computing. Despite its long and sometimes difficult gestation period, the 80286 is a clear winner, as evidenced by the number of new products that use it. While the migration path it lights from the 8088 is a key factor in its success, its expanded instruction set, speed, and addressing capabilities have been refreshing for both operating system designers and application developers. It exemplifies the continued growth and vitality of our industry. Turning ideas into silicon is one of the most arduous tasks humanity has yet invented for itself, but bringing forth a product like the 80286 is its own reward—especially for Eugene Hill, project leader, and Jim Slager, logic design manager for the chip.

Jeff Garbers: Infoscope

People look at *Infoscope*'s user interface and say, "Gee, I wish I'd thought of that." But the slickest user interface

doesn't buy you much if the program doesn't perform. With *Infoscope*, Jeff Garbers has set a standard for combining performance with ease of use. *Infoscope* doesn't represent artificial intelligence, but it shows real intelligence in letting users decide how to format their data and how to

chaotic world of public-domain software, in the form of over 100 disks in the PC Blue series. Henry has cataloged and organized each of them. PC Blue disks are well distributed through user groups and mail-order channels. They work synergistically with commercial products, addressing markets that are too small to warrant commercial support. Kee's packages allow users to try a genre of software for little or no cost, then trade up to commercial products when their needs require more than the abilities of user-supported software.

The Presentation

PC Magazine presented these awards during Spring COMDEX in Atlanta. The smaller of the two annual COMDEX shows, the spring event is still an important gathering of the clan, a time when the industry gets together to see the new products and offer its wares. At an awards dinner held at Atlanta's Swan House mansion, we presented each winner with a specially designed medallion cast in sterling silver. In a world already crowded with plaques, prizes, and tacky bowling trophies, we wanted to create an award that conveyed the depth of our respect for the creativity and sheer craftsmanship of our recipients. Each medallion is a handmade, personal creation, as unique as the talents of its recipient. We found it especially fitting that our silversmith is also a programmer whose favorite form of expression is assembly language.

These awards are actually long overdue. The best-selling packages receive awards. The entrepreneurs receive adulation. The marketers are lauded in the trade journals. In some cases, our winners are also the entrepreneurs who take the big risks. Other unsung heroes are simply employees of their companies. The key here is that it doesn't matter. *PC Magazine* has presented these first annual awards for technical excellence to individuals whose efforts are unarguably among the most important for 1984. They have advanced the state of the art. They have changed the direction of the industry. They are worthy of our praise. ■

Bill Machrone, editor-in-chief of PC, and Jeff Weiner, publisher (in center), chat with some of the award recipients.

manipulate it. It exemplifies Garbers's devotion to doing things right.

Robert Hamilton: Enable

When *Enable* was first demonstrated at *PC Magazine*, we yawned. "JAIP," we said (Just Another Integrated Package). Okay, the spreadsheet was powerful. And yes, the graphics were sharp, and the word processor wasn't bad. Then the demonstrators took a graph and merged it into a text file. Not bad. But when they edited it, that was too much. "You can't do that," we said. "Enable can," they replied. And that's the real story behind *Enable*: its creator, Bob Hamilton, was determined not to create a me-too product. His is a restless intellect, one that refuses to take no for an answer, one that continually seeks new challenges.

Henry Kee: PC Blue Series

All of our award recipients are driven, committed to their ideas and ideals. But we have singled out Henry Kee as the man most committed to the idea of personal computing. He has imposed order on the

Profiles In Technical Excellence

Their names aren't household words, but their achievements put them far above the crowd. Let us help you get to know the people whose products shape our present and future.

It was the classic 7-day work week that you get with fervent believers."

Robert Carr/Framework (Ashton-Tate)

When he first conceived the idea for *Framework*, Robert Carr was working as programming consultant on a different product—an integrated spreadsheet package called *Context MBA*.

"I was convinced," Carr says, "that integration was a powerful idea that brought many benefits with it. But I also thought that integrating around a single large spreadsheet constricted the user. A more appropriate method would allow the user to break information into many smaller chunks that could be linked together logically." This, according to Carr, is the heart of *Framework*: it permits you to break up your data into separate frames in any order you like. "Based on that conviction, I thought, What the hell, why don't I try programming it? So I started programming it on my PC, hoping I could prove the idea workable, implement it, and start a company to market it."

Carr, 28, had done a stint at Xerox's Palo Alto Research Center, where he worked on predecessors of Xerox's *Star* and *Smalltalk*. He holds B.S. and M.S. degrees in computer science from Stanford University.

In January, 1983, after a year of designing, Carr began to create a program to embody his idea (which he called FRED for "Frame Editor") and by June it was clear that the programming effort was even more successful than he had hoped. "I was beginning to talk to some companies when Marty Mazner, who has more marketing background than I have, came by, saw FRED, and asked 'Do you know what you have?' We got to talking and decided to cofound Forefront."

Their goal was not to organize a software company that would superintend the product through its appearance on the store counters, but to start a development corporation that could finish the product and team up with a leading publisher. "In July, 1983 we decided to go to Ashton-Tate first," Carr remembers. "We got a terrific reception. Within 2 days we concluded an agreement stating that they would both act as venture capitalists and get marketing rights to *Framework* and would also get rights

to buy Forefront in 1986." In fact, the product was so successful that Ashton-Tate recently announced an agreement to buy out Forefront sooner.

So, beginning in September 1983, Carr and company spent a feverish 10 months laboring to finish *Framework* ("It was the classic 7-day work week that you get with fervent believers," Carr says) and were able to finish the work in a relatively short period of time.

"*Framework* is certainly not a result of my efforts alone," Carr insists. "Six other individuals worked with me day and night for almost a year. It's very much a result of their good ideas and excellent work. They and all of the teams need to be recognized by the software industry. Few products have been the result of one individual's effort."

Since then, *Framework* has established itself as a major product in the integrated software market. "Integrated is a very loose term," says Carr. "An incredibly wide-ranging bunch of products fits under it. People who buy *Framework* find that it's easy to learn and use. Most software packages demand about 50 hours of training. But although you have to make a learning

investment the first time you come to *Framework*, that training applies to all the different functions. If in the next week or month, you want to pick up say, the word processing function, you'll find that it works very much like the spreadsheet." Carr foresees an important role for integrated software in the move toward widespread use of local area networks. "The whole industry is moving from personal to group productivity tools," he asserts. You can expect to find Carr and *Framework* riding on the crest of that wave.

Technical people with no venture capital were able to build a company that is now number 5 in the software industry."

Phillipe Kahn/Turbo Pascal (Borland Intl)

"It was a gamble," says Philippe Kahn. Sometimes a gamble pays off; in Kahn's case, it resulted in the top-selling language compiler Turbo Pascal (see Power User, this issue) and a new company, Borland International, that has quickly made a name for itself in the highly competitive software market.

Kahn, who received the French equivalent of a Ph.D. in mathematics from the French Academy of Sciences, taught mathematics at the university level in Nice and Grenoble before coming to the United States. He became enamored of the principles and potential of Pascal when he studied under Niklaus Wirth, author of the language. So when Kahn arrived in California 3 years ago, he got together with two close associates and surveyed the software market.

"We saw that the only uncluttered market that was available at that time was in languages. Everybody was trying to do spreadsheets and word processors and databases. But nobody was paying attention to languages, so the quality of available languages was very low." They decided to produce a Pascal environment for the IBM PC. "We wanted the product to run in less than 64K RAM. That was extremely important. It's easy to run compilers in 256K, but we wanted a low-memory interactive system with a powerful editor that people could use on machines with a single floppy disk and save the rest of their memory for other things. It also had to be fast in compilation and execution." He smiles. "Nobody believed it."

In fact, venture capitalists were so skeptical that Kahn and his colleagues decided to do it totally on their own. In November 1983 they tossed Turbo Pascal into the marketplace.

"At that time," he recalls, "there were four people working

at the company. We didn't even have an advertising person—I put together the first ad for Turbo Pascal at midnight with a girl who knew how to do pasteups. Later, we hired an advertising guy, but he left us because we decided to go back to our basics. Doing it ourselves was better."

Since its introduction, Turbo Pascal has become the best-selling version of Pascal and the fastest Pascal language compiler. It is making Pascal the most popular language at the academic level: More than 450 universities use it worldwide, and it has sold over 300,000 copies. Borland International has grown in 2 years from two rooms over an automotive repair shop to a company that employs more than 100 people.

"It's really a case where people who are not marketing or advertising experts—who are, in fact, technical people with very little management experience and no venture capital—were able to build a company that is now number 5 in the software industry," he says proudly.

Kahn is the author of several books, a big fan of science fiction and gourmet Chinese food, an avid sailor, and an accomplished jazz saxophone player. He is 33 years old and lives with his wife, Martine, and his two daughters in Aptos, California.

Although Borland has produced an entire family of language development tools since launching its first product, Kahn takes particular pride in Turbo Pascal. "Turbo exemplifies our philosophy of bringing only high-performance software with a technological edge into the market at a reasonable price," Kahn asserts. "Turbo is Borland's first contribution of real software tools to personal computer users."

We've been able to do a few things that our professors had told us were not practical to do in a computer."

Jim Slager and Eugene Hill/Intel 80286

Most microcomputer experts will agree that one of the most important hardware developments in recent years has been the Intel 80286 processor. Jim Slager, who, together with Eugene Hill, contributed considerably to the chip's development, is very much aware of its importance. "So far, it seems to be the most successful chip that Intel ever made," he says. "It may turn out to be the most successful chip that anyone's ever made."

Slager, the logic design manager for the 80286 microprocessor, has been with Intel for 7 years. Previously, he worked on the first MOS computers at Bunker Ramo Corporation and with the PPS4 and PPS8 microprocessors at Rockwell International. He received his B.S.E.E. from the

Left, Jim Slager; right, Eugene Hill.

University of Illinois, where he also worked on the Iliac 4 project. Slager lives with his wife and daughter in San Jose, California.

"I think the most important thing about the 80286 chip is that it came out at the right time to exploit the PC market," Slager continues, "although that's not what we thought about back in 1979 when we designed it. But the chip was there when the PC market was still growing, and it fit right into it."

Hill, a design manager for Intel, was the project leader for the 80286 chip during the 6-month period devoted to samples. He oversaw the chip's design, layout, and architecture.

"Several factors contribute to the chip's importance," Hill asserts. "It's the first time I've seen a fairly complex microarchitecture actually implemented on silicon, where several logical units are all operating simultaneously. I think that's an important trend. There are many classical approaches to building very fast machines, and I think we're on the verge of implementing a lot of those in silicon."

"I think that previously, technology hadn't really allowed for a system to be put on silicon. However, by doing that, we've achieved quite a performance gain, and we've been able to do a few things that our professors had told us were not practical to do in a computer. I think in the future, a lot of integration and functions that were traditionally found in CPUs will go on boards."

Hill has worked at Intel for 9 years and is currently working as the project leader for the 80386 chip. He chaired the definition group for the Intel 8051 while managing its microcontroller

It may turn out to be the most successful chip that anyone's ever made."

group. Prior to working for Intel, Hill worked at Collins Rockwell and American Microsystems, designing everything from telephone equipment to the first digital television sets. By the time he was 30 years old, he had designed 30 chips. He received a B.S. from Oregon State University in 1969 and did graduate work at the University of California's Irvine and Santa Clara campuses, and at Long Beach State. He lives in Cupertino, California with his wife and two children.

It's not unlike childrearing. Some days you feel awful, and some days you're sure it's the best baby that's ever been born."

Jeff Garbers/Infoscope (Microstuf)

"Well, it's one of those things you have to see to appreciate," grins Infoscope creator Jeff Garbers. "It's a highly interactive visualization system that lets you get out and twiddle with your data. When we first developed *Infoscope*, we batted around a lot of names. One of our favorites was 'Electronic Platypus.'"

Whatever its name, the program that Garbers describes as an "electronic recordbook or dynamic information system" has turned out to be quite successful. *Infoscope* has developed into a very popular database product that is simple and flexible.

The 25-year-old Garbers, a program designer at Microstuf, Inc., has been important in developing software that adapts itself to the user's needs, interests, and vocabulary. Like many of today's software whiz kids, he started young—at age 11. "I saw some of my Dad's IBM manuals, got interested in them, and taught myself COBOL," he recalls. As a senior in high school, he took a data processing course that gave him access to a computer once a week. He went on to Wabash College in Indiana, where he majored in math and worked part-time in the

computer center. In January, 1979, he bought an Apple II and began to learn things for himself.

Garbers then entered Georgia Tech, where he was introduced to the theories of human factors through a course taught by Dr. Albert Badre. Instead of focusing on a system's potential ability, Garbers learned to visualize products from the user's standpoint.

"I was teaching a class in Pascal," he explains. "I had about 60 students and I had to keep track of their names, social security numbers, majors, grades, and stuff. I didn't have my PC yet, and had to put the information into *VisiCalc*; I could do computer averages, but if I wanted to know whether science majors were doing better than nonscience majors, for example, *VisiCalc* didn't let me answer such questions. I thought about getting a database system, but it wasn't worth hours of my time to go through those menus. I wanted something more spontaneous."

After completing his M.S., Garbers left Tech and formed a company whose name made his philosophy clear—Userveiv Corporation. He began work on a versatile data management program that was to become *Infoscope*.

"It wasn't a trivial undertaking," Garbers admits. "It took 2 years to write. My unique form of fanaticism is that I still sort of do things the old-fashioned way: in assembly language." He smiles. "It makes my C friends roll their eyes. I decided that assembly language was best in order to make the program quick and responsive. I wanted the fastest sort on the planet. And if I write code, I want it talking directly to the processor."

"A lot of things just happened along the way. Many times I felt like I was running into a brick wall; I'd sit around for a while and finally figure out a way to dig a hole underneath and get through that way. It's not unlike childrearing. Some days you feel awful, and some days you're sure it's the best baby that's ever been born."

In late 1982, Garber turned the organizational problems of Userveiv over to Microstuf, a company whose outlook matched his own. He and Microstuf president Les Freed "both saw that the computer business was moving toward users who didn't have the interest or the patience to figure out obscure programs. Someone had to create programs that cooperated with this very large group of computer newcomers."

There is a definite parallel between *Enable's* structure and that of a human organization."

Robert Hamilton/Enable (The Software Group)

"There is a definite parallel between *Enable's* structure and that of a human organization," says Bob Hamilton, creator of *Enable*. "The master control module, which we affectionately call the corporate staff, maintains common services for each of

the applications, which we refer to as the divisions. It also has a president responsible for controlling the environment, a receptionist, a public relations manager responsible for releases, and a small army of clerks. *Enable's* speed, efficiency, and consistency is a consequence of that internal structure."

Hamilton is the vice president of software development for the Software Group. He characterizes *Enable's* creation as "the challenge of developing a set of productivity tools that combine the power of mainframe systems, the functionality of special-purpose standalone products, and the ease of use, speed, and affordability of micro software."

Hamilton came to the Software Group after two years at Thyssen-Bornemisza, where he served as the multinational Information Technology Group's vice president of new product development. As vice president of systems development for Bibliographic Retrieval Services, Inc. (BRS) from 1976 to 1980, Hamilton was responsible for the design and management of such technical projects as modifying CICS internals and IBM/STAIRS (which reduced CPU use and storage requirements), and developing a multiuser full-text retrieval software package for large IBM mainframes.

Before he went to BRS, Hamilton served as the director of bureau of identification of the New York State Division of Criminal Justice Services and the director of admissions for the State University of New York, where he developed an on-line CICS-like system in an OS/370 environment. Hamilton has a B.S. and M.S. degree in aerospace engineering from the State University of New York in Buffalo. He has been married for 23 years, has four children, and resides in Clifton Park, New York.

While at BRS, he began developing the concept that would eventually become *Enable*. "The impetus came from looking at the marketplace," Hamilton said, "and deciding that improvements could be made." He and colleague Ron Quake began looking at the possibility of creating a multiuser business system with groups of tightly integrated applications such as word processing, database management, spreadsheets, and so on. "We felt that it wouldn't be too much longer before the hardware necessary to support that environment would be commonplace. In that environment, you'd need a software design that would support multiple users right up front, not added on as an afterthought. *Enable* came from looking at where the

hardware was going. Since we had some experience with other software, we moved toward what we felt would be a complete set of horizontal products."

As the developer of *Enable*, Hamilton is certainly not resting on his laurels. Future versions will have a sophisticated menu generator and a standard interface with high-level languages meant to give program developers full access to all of the applications within *Enable*.

"This interface will really provide a greater set of tools, a better starting point," Hamilton says. "Furthermore, it means that all of the files will have compatible data structures. It will be very easy to move data from one application to another."

The tremendous success of *Enable*, Hamilton added, has had a great deal to do with the extensive background of the applications teams that have done work on the project. "Each member has about 12 to 13 years of experience with systems programming in a mainframe environment. So we will certainly continue to expand and improve."

In today's market there is no longer any outlet for selling your own software."

Henry Kee/PC Blue Series

"In today's market there is no longer any outlet for selling your own software," explains Henry Kee. "The public domain offers a forum for the cottage industry software author to put his or her wares on display."

Kee, a vice president in information services at Chemical Bank in New York, has played a major role in keeping that outlet vital. He started the PC Blue series in the early part of 1982 as an extension of the already existing SIG/M Users Group Library of Public Domain Software for CP/M personal computers. The system he set up enables PC users to receive and copy a large variety of author-contributed programs.

PC Blue is certainly not Kee's only accomplishment. He is a regular panelist on WBAI Radio's "The Personal Computer Show" in New York and a member and director of both the Amateur Computer Group of New Jersey and the New York Amateur Computer Club. In addition, he is the systems operator for the New York group's bulletin board. The founder of the PC Blue User Group Library of Public Domain Software for IBM PCs is also the cofounder, former editor, and librarian of the SIG/M Users Group Library of Public Domain Software for CP/M personal computers.

Before joining Chemical Bank, Kee worked for Blythe, Eastman, and Dillon Company; Honeywell; and Chase Manhattan Bank. He has a B.A. in mathematics and science from Wagner College in Staten Island. Kee is married and is

currently residing in Flushing, New York.

As you might guess, the PC Blue series is not a highly profitable venture. But then, it's not meant to be. "Unlike some libraries, we're not out to make money," says Kee. "We make the programs available through distribution outlets such as computer clubs. We now have up to 30 clubs receiving the library, and we encourage them to make copies for their members. They charge their members a \$1 fee and use the money to fund the club activities. For those who are not in any clubs, the New York Amateur Computer Club provides the programs to users when supplied with media, postage, and handling." He smiles. "It's worked out pretty well. We have a high level of acceptance, and, as a matter of fact, a lot of authors now submit material to us directly."

Kee, whose work has not gone unrecognized in the microcomputer industry, is proud of the special nature of his award from *PC Magazine*. "Five of the six awards were for creativity. Mine had to do with creativity but with public service and a lot of hard work. I've gotten a lot of awards, but this one I cherish."

According to Kee, the authors who contribute programs to the PC Blue series can be divided into three different groups: altruists

who simply want to share their software with the world, glory seekers who want to show others how clever they are, and serious programmers who are looking for a distribution outlet for their products.

"People are collectors," Kee asserts. "They want to build up a software library of their own."

PC Blue gives the programmer a chance to say "Here's a copy of my program; if you like it, you can send me money, but you don't have to"; or, alternatively, "Here's a 90 percent working copy of my program; if you like it, give me money and I'll send you the full version."

Only one thing bothers Kee these days: the exploitation of PC Blue. "People are starting to advertise the rental of libraries, and I can't stop it. In a sense, I'm doing the work, and they're taking the money."

By collecting and distributing programs that might otherwise have gone unnoticed in the microcomputer industry, Kee has helped keep that industry vital and exciting. ■

Buy Fuji Film Floppy Disks and get up to \$25 at a clip.

Now through October 15, when you buy Fuji Film Floppy Disks, you not only get a disk you can count on, you can also count on getting cash back—\$2 on any size 10-pack (3.5-inch, 5.25-inch or 8-inch), \$5 on two ten-packs, up to \$25 in total. Your local Fuji dealer has details. See him and get a quality floppy disk that helps you save more than just your data.

FOCUS ON PC TRAINING

SHAPING THE LEARNING CURVE

Most users need some training to learn a new program, no matter how "intuitive" the interface. But effective training involves more than just a one-day seminar or one-hour tutorial. The training solutions portrayed in the following articles will help you target your needs, design a well-focused, workable plan, and spend your training dollars and hours wisely.

User friendly has become a phrase that invites snickers. Software just isn't friendly. Neither is it intuitive—a word that has shown signs of replacing user friendly. The term "intuitive software" implies that a user can sit before a PC and understand how to manipulate the software on sight. Even assuming that an interface can be called instinctive, the amount of human behavior driven by instincts is debatable. I submit that while we may have a survival instinct, we do not have a software instinct.

Learning is simplified when you are

able to relate it to past experiences—for instance, waterskiing is easier to learn if you already feel comfortable in the water. The only thing even remotely "intuitive" about learning to use a PC lies in its loose resemblance to televisions, typewriters, and dinner menus. Knowing how to adjust a television screen, press keys, and order filet mignon in a restaurant is, however, a long way from understanding the intricacies of magnetic and electronic media, software interfaces, and machine intelligence. Since software interfaces are so different and so alien to the average adult's experience, "intuitive software" is little more than a marketing slogan for now.

OBSTACLES TO LEARNING

Three factors make PCs more difficult to use than other electronic equipment such as microwave ovens and cars: a large number of features, the lack of a common language, and infrequency of use.

Popular word processors typically contain over 100 features, of which about three quarters are needed for general use. This number is likely to increase because the popular vote (counted in terms of sales dollars) has judged that more features are better. Complex software packages sell

better than simpler ones—witness the popularity of the multifeatured *MultiMate*, of *1-2-3*, which adds many features over earlier electronic spreadsheets; and the recently released *Symphony* and *Framework*. Clearly, users want enough features to meet a range of needs, even if having it all involves maneuvering around features they don't want.

The keyboard is another rather messy communications tool because it, too, has a large number of unstandardized features. Recently, software manufacturers have tended to swallow their pride and suppress their individuality to make summoning help easier: most now use F1 or an F1 key combination. Some named keys like PgUp, Ins, and Esc also have fairly predictable results. But that is about as close as anyone has come to a common keyboard language: the rest—more than 100 keys and key combinations—is up for grabs.

The keys on the keyboard form a sym-

THE BETTER LETTER BOX

Introducing EasyPlex.[™] The new, easy-to-use electronic mail system from CompuServe.

Finally! Electronic Mail that's so easy to use you can start composing and sending messages the first time you get online.

Designed for various experience levels, EasyPlex has a menu mode with simple, easy-to-follow directions for beginners, and it lets experienced users save time by working in the prompt or command modes. With EasyPlex, you can compose, edit, send, file, and take advantage of sophisticated

options previously available only with more expensive services.

CompuServe's EasyPlex lets friends and relatives, associations and club members communicate any time of the day or night. And small business owners, real estate professionals, insurance agents, lawyers, writers, etc. can communicate quickly and simply—either interoffice or interstate. "It's Easy." "Just Plex it!"

Best of all, EasyPlex is available to all CompuServe subscribers. And, along with EasyPlex, you get hundreds of valuable and entertaining computing options. Plus the assurance of belonging to the largest, fastest

growing computer information service in the world and the premier supplier of business information to FORTUNE 500 companies.

Start communicating! To buy a CompuServe Subscription Kit, see your nearest computer dealer. To receive our informative brochure or to order direct, call or write:

FOCUS ON PC TRAINING

bolic language. But because the symbols are so generic and their meanings vary so much from package to package, users often resort to color-coded prompt cards, self-adhesive key tops, and keyboard templates to keep track. In other words, they must add another set of symbols to help them interpret the symbols already on the keyboard.

SPEAKING IN TONGUES

Adding to the difficulty of learning a large number of software features are language inconsistencies among competing software packages, among products in the

emerged PC user by making it easier to move across software packages. It would also drastically reduce the need for training.

Unfortunately, without some impetus, significant standardization will not occur for a long time. The PC software industry is still too young and too creative for common features and user interfaces to emerge though a gradual evolution is likely. In the meantime, training can bridge the gaps created by a lack of standardization.

Frequent use is the third element that contributes to ease of learning. Although language and number of features are under the manufacturer's control, regular use is

various as will the amount, but mastering the use of any software package requires a learning aid.

According to a study by the International Data Corporation, a research firm, 61 percent of the companies that use PCs provide training. An annual census taken by *Training* magazine places that figure at 57.8 percent. Both sources indicated that training in large companies tends to be more formal than in small companies.

The training activities vary also. A major West Coast corporation whose employees are mostly engineers doesn't provide PC training on the grounds that engineers don't need it. For them, training consists of reading the documentation. Since software manufacturers are doing an increasingly better job of writing self-instructional materials, additional training may be unnecessary for engineers and others who have a technical background.

For most people, learning to use a software package is plain hard work; for others, it simply requires time and patience—something that most adults have in short supply. As you read the articles that follow, you'll see that a variety of training approaches have emerged to meet different learning styles and temperaments.

Since software still has a long way to go before it is truly easy to use, training will be needed to integrate PCs into the workplace.

Independent research firms predict continuing growth in the computer training business. As computing skills increase, the primary need for PC training will shift from basic literacy to more-sophisticated business applications. No matter how "intuitive" software becomes, the challenge of applying software tools to specific business problems won't go away. As long as software imposes a certain logic, users must learn to understand that logic. Even if computers achieve the free-form communication promised by science fiction, training will be needed to extend computer resources and help make them more responsive to specific business needs. ■

Kate Barnes is president of Barnes Associates Learning Systems, a developer of computer training programs based in Tucson, Arizona. She is a columnist for PC Week.

Unfortunately, without some impetus, significant standardization will not occur for a long time. The PC software industry is still too young and too creative for common user interfaces to emerge, although a gradual evolution is likely. In the meantime, training can bridge the gaps created by a lack of standardization.

same software line, and sometimes even within a single product. Fortunately, the situation is improving as software developers recognize the need for interface standardization. Over the years, language will pose less of a problem. At first a barrier to learning, computer jargon is weaving its way into everyday conversation, as in "Let me get out of this loop!" "What's this column of cells?" and "My boss erased that incident from his long-term memory."

Some terms are slowly becoming standard. Commands like INSERT, PRINT, QUIT, and EXIT result in the same action whatever software is used. When there isn't an accepted, standard term for a particular function, the best the manufacturer can do is choose a common word that most closely suggests that function. Words like *setting*, *line marker*, and *shadow*—whose meanings are still a bit fuzzy—reflect this practice.

Standardized language and features will benefit both the novice and experi-

not. The manager who calculates budget figures with *Symphony* once a month will have more trouble than the person who uses the package every day. Most *WordStar* old-timers are so familiar with the key combinations that they could play *WordStar* trivia over a beer after work. Meanwhile, back at the office, sporadic users have trouble even when a menu is staring them in the face.

Familiarity presents another dilemma, however. Once a particular set of software commands has been ingrained in memory, trying to erase it can cause problems. For example, users switching database packages will pray that the familiar commands won't cause irreparable harm if they accidentally (and inevitably) enter them when using the new package.

USING POWER EFFECTIVELY

These obstacles to learning mean that for the foreseeable future, anyone who wants to use the power of a PC needs some sort of training. The form of training may

INDIVIDUAL TRAINING:

A MATTER OF STYLE

The best way to teach yourself a software package and explore its idiosyncracies depends on you: the amount of money you can afford to spend, the time commitment you're willing to make, and the learning method that suits you best.

Disk tutorials, seminars, audios, videos, workbooks—anyone who has tried to learn the ins and outs of a software package using one of these common PC teaching aids knows that one person's solution is another one's problem. So once you're ready to start learning, the first step is deciding which method is right for you.

Experts agree that people learn differently and that their preferences vary when it comes to how they learn. Belinda Ulrich, an assistant vice president in charge of PC training for the U.S. Trust investment bank, feels that effective training depends on an individual's style. "Some need to do, and some need to watch; some like to press buttons, and some are afraid of pressing buttons. A good deal depends on the amount of previous exposure to computers."

Choosing among the various training methods often boils down to a question of time versus money. According to Doug Cobb, the dynamic trainer, publisher, and *Symphony* whiz behind The Cobb Group training firm, "The best training for an in-

dividual depends on that person's needs and resources. There's a tendency to look at training options as separate minitools. Actually they are part of a price/time continuum from low-cost, labor-intensive books to one-on-one consulting." Another often-overlooked factor to consider, says Cobb, is the user's experience. Experienced users have the advantage of being able to work alone; hence, they can use a book or other self-teaching method.

ALL IN THE PACKAGE

Can you find happiness and fulfillment without spending money on supplemental training? Most users and experts agree that manufacturers are paying more attention to providing adequate training materials with their software. Sorcim/IUS's well-reputed *SuperCalc3* contains a mind-boggling selection of instructional materials. Included in the package is a *Ten Minutes to SuperCalc* quick-start pamphlet, a context-sensitive help screen, a comprehensive reference manual, a print-based tutorial, a quick-reference answer card, and prebuilt spreadsheet files with a wide variety of examples. In addition, Sorcim maintains a

INDIVIDUAL TRAINING

phone hotline and offers training seminars for dealers.

Sorcim marketing manager Jim Cansler estimates more than 25 percent of *SuperCalc*'s cost is related to support materials. "The training materials we provide cover a number of different levels," says Cansler, "but they involve a lengthy learning period. Those who need to gain proficiency quickly or those who are not familiar with personal computers typically look elsewhere."

"As packages grow more sophisticated and there are more things to be learned, the user will want to look to outside sources

W hich training materials work best?

The answer is as per-
sonal as the computer
itself. Search your
soul, and identify what
it is you need to learn.

who have developed curricula and strategies for teaching the program," suggests Scott Brown, Ashton-Tate's technical public relations manager. Ashton-Tate, creator of *dBASE* and *Framework*, actively participates with third-party training developers and finds the relationship a symbiotic one. The company has also developed its own supplemental courseware including workbooks, reference books, and disk-based training.

WHY NOT THE BEST?

Which training materials work best? The answer is as personal as the computer itself. Search your soul as well as your pocketbook, and identify what it is you need to learn. "Someone who says 'I want to learn how to use 1-2-3' is often actually asking 'How do I use this machine?'" observes Russ Walters, author of *The Secret Guide to Computers*.

INDIVIDUAL TRAINING

THE BOOK WORMS

If you enjoy reading and learning on your own, you're likely to turn to books to get the computer training you need. It's easier to skim through a reference book than a disk-based tutorial or cassette tape, and you can reuse a book without getting bored as you might with many other learning materials. A good software training

book is full of examples that teach you how to apply as well as use the program. And the nicest thing about books is that they're cheap and plentiful.

Be cautioned, however: Learning to use complicated software from a book requires effort and academic gumption, and it can be difficult to work with a book and a computer screen simultaneously.

Training books come in many flavors: reference books, workbooks with examples, books aimed at power users or novices, and books with accompanying disks. Most are written by notables in the field. Some are charming and intimate, others more concise and efficient.

Russ Walters defines his concept of a computer learning book. "A book should

Here are some points to compare when choosing a training method. How does the one you're considering rate?

be a reference, so you can look up information quickly. It should be a tutorial offering step-by-step examples. It's got to provide an organizational overview, and it should be a motivator. It should do these things very quickly, keeping examples as short as possible."

"To date, the book is by far the cheapest way to learn a skill," says Rodney Zaks, president of Sybex Publishing, a leading computer textbook publisher. "It involves one difficult aspect: reading. Because people need the skill, they will sometimes resentfully pick up a book to train themselves. If the book is good, they will continue."

If you're in a rush, however, a book is probably not the answer. Even the shortest, most captivating book may take more time to read than you have to spend. "If your boss puts a copy of *dBASE II* on your desk and says he wants a program by next week, a book won't help," says Walters. Nor are books a viable option for the casual user, according to Joel Rakow, president of ATI (American Training International), a national training firm. "If you use the software 10 or 15 percent of the time, you can't afford to spend a week learning it."

AUDIOPHILES

Those who are better listeners than readers will enjoy learning using audiocassettes. Initially I pooh-poohed the idea of using my antiquated cassette player as a teacher, but after taking a few courses I found that listening and doing complement each other well. Of course, flipping and re-winding tapes is much more tedious than paging through a book, but if the tape is well organized, the mechanics are minimal. Skipping past undesired lessons is a chore (a good counter on your tape machine is a must). But all things considered, tapes are an inexpensive, relaxing way to learn.

There's enormous variation in the quality of audio training on the market. There aren't too many large-scale manufacturers of audio training tapes. Home-brewed tapes tend to be low-tech, containing straight narrative.

The popular FlipTrack Learning Series permits optional branching, allowing you some choice in the learning process. "FlipTrack brings another medium into

the picture," says Lee McFadden, president of FlipTrack and creator of the series. "It offers personalized instruction without the cost of a seminar or consultant. You can be involved with the keyboard and screen without having to avert your eyes to a book. The simulated environment of a disk-based tutorial is eliminated. There's nothing buffering reality." McFadden adds that you are free to make mistakes (and learn from them) with the FlipTrack series.

Another interesting play on the audio theme comes from User Training Software of Campbell, California. UTS's patented audiodigital technology lets your RS-232 port communicate with its playback unit.

firms, offer series of PC videos that tend to be elaborately staged productions and impart knowledge in a personal and entertaining way. These companies bank on a segment of learners that, as ASI's director of marketing Richard White puts it, "don't feel comfortable sitting in front of a computer" and "like to learn by watching."

Video training has some inherent problems. "Either you're not sitting at the terminal and practicing, so you're passively listening and watching, or you're busy fussing with the video rewind and pauses so you can work interactively with your computer," observes ATI's Joel Rakow. While you may be able to tolerate a disk-based tutorial or a book for a second round,

If you enjoy reading and learning on your own, you're likely to turn to books to get the computer training you need. It's easier to skim through a book than a disk-based tutorial or cassette tape, and you can reuse a book without getting bored as you might with many other training materials.

As you hear an explanation on the tape, you see it executed on the screen. By toggling the playback unit off, you can exit the tutorial and practice with the software on your own. While this technology is significantly more expensive than the traditional cassette tape (about \$4,000 for a full course and hardware), you get to listen, watch, and do.

VIDEO LEARNING

"Someone who has a phobia about machines will do better looking at a video than a computer," says Gil Herman, senior product developer for Deltak, one of the largest producers of video and disk-based training materials. Videos are an effective tool for those who don't need to learn how to operate a package but want to understand the conceptual framework behind it.

Deltak and ASI (Advanced Systems, Inc.), as well as other national training

the prospect of watching a video rerun is a gloomy one. Although the "real-life" scenarios often portrayed on training videos are frequently contrived and stereotyped, once they get to the meat of the course, they can offer a relaxing, exotic way to learn.

Good-quality videos are expensive, costing as much as \$5,000 a minute to produce. When production costs go down, video may be a viable option for the individual user.

COMPUTER-BASED TRAINING

"For the person who can use the keyboard and load a program, the disk-based tutorial is superior to other forms of training," says Richard White of ASI. If you don't want to randomly muck around with your program and can't afford a seminar, then disks offer an affordable, sheltered learning environment. Typically, disk tutorials cover hard-core applications such as

INDIVIDUAL TRAINING

DOS, MultiMate, WordStar, and Frame-work, and they tend to be good skill-builders for practicing program commands and keystrokes. Unfortunately, many of them fall short of the mark when it comes to applying the information that's learned. Many of the better disk-based tutorials from national training firms can be expensive, primarily because of high develop-

applications. Programs such as QED's Typing Made Easy are interactive and fast-paced and impart knowledge in discrete, palatable modules.

Disk tutorials can be interactive, but they can't offer too many answers to your questions. Because they are difficult to "page" through, because they quickly become tedious, and because they are dumb

needs," says Joe Sabrin, vice president of the PC Executive Training Center (PC ETC), a New York training firm. "If we know we're training bankers or lawyers, then we gear the application to them." Tom Vayda, senior training consultant at PC ETC, says, "A corporate person doesn't have the time to read a book or take a college class. While there's no way you'll get everything you need in a day-long, hands-on seminar, you get a heavy dose of knowledge that you can take back and assimilate in the comfort of your office."

A hands-on seminar is a wonderful hand-holding, phobia-reducing exercise for experienced users. It's also a good method for those who need to learn skill-based applications, such as word processing. But for people who know how to use a computer and want to familiarize themselves with a particular software package, the lecture, or "hands-off" seminar, may be a better solution.

"We want to impart maximum knowledge in 2 days," says Doug Cobb, describing his fast-paced *Symphony* training sessions. "You don't get maximum knowledge when you're sitting and typing at the keyboard."

"A lecture circuit has a much higher bandwidth; it's a more efficient way to learn large amounts of information. You

A hands-on seminar is a wonderful hand-holding, phobia-reducing exercise for inexperienced users. But for people who know how to use a computer and want to familiarize themselves with a particular software package, the lecture, or "hands-off" seminar, may be the better solution.

ment costs, and the better material is available through corporate channels and not from the retail market.

The top tutorial programs are written with proprietary authoring systems so that the training software closely simulates the actual program, enabling you to try your hand at the real thing without running the risk of doing any damage. Most employ some form of split-screen technology so you can view the training on one half of the screen and the simulated software on another. ASI's Advanced Architecture Courses and Deltak's How to Build a Business Plan series are two new courses that attempt to infuse keyboarding and command skills while also challenging you to apply what you learn.

"Disk-based tutorials are pretty good on keyboarding stuff," says Les Squires, director of training and documentation for the Boston Computer Society. "They can check to see if you've spelled the word right, if you actually pressed a key, or if your syntax for a command was correct. But floppies are inherently limited. Until we get to the seventh generation of computing, they will never get beyond press this, press this." On the other hand, this feature makes disk-based tutorials ideal for learning the keyboard and skill-oriented

(albeit patient), disk-based tutorials have a long way to go before they become the ultimate training solution.

SEMINARS

Traditionally, training seminars have been expensive and have therefore been confined to the domain of businesses who were able to afford to send their employees to them. "There's definitely a feeling among users that they want hand-held guidance—hence seminars," reports Joel Rakow, of ATI, which recently introduced a series of software training seminars.

Recently, computer stores and local training centers have made seminars an affordable reality for the individual user. At ComputerLand's Long Island stores, seminar prices range from \$50 to \$125 depending on the level of instruction—beginning, intermediate, and advanced. Alisa Metal, software and training support manager for the stores, believes vehemently in the hands-on seminar approach. "If you sit at a piano with a piano instructor, you learn the piano. We make it possible for people with any level of expertise to have nearly individualized instruction for affordable prices."

"Unlike books or tutorials, hands-on seminars don't have to anticipate people's

TAKING A CUE FROM THE FORTUNE 500

Lecture/lab	79%

Interactive video	17%

What do Fortune 500 companies do for employee computer training? This table shows what methods they choose, according to the Yankee Group, a Boston-based consulting firm.

can always look up the keystrokes," says Adam Green, one of the celebrities of the computer lecture format. "Learning about computers is like learning about a car," he continues. "If you didn't know what a car was and needed to learn how to drive, I'd put you in the driver's seat. But if you wanted to learn about touring Europe, why would I give you a car? I assume people al-

fer much individual attention. If you feel you need intensive one-on-one instruction, your only alternative is to hire a consultant—and pay a consultant's high fee. "Like the piano student," says Les Squires from the Boston Computer Society, "if you want to learn Chopin, you'd better hire a private teacher. Then you can't complain that the teacher taught you

ready know how to drive and are looking for some interesting places to go."

Green and Cobb distribute plenty of take-home materials for users to complete when they are not running the meter on expensive teaching time. Both lecturers charge around \$250 per day.

Finding a good training seminar is like playing Russian Roulette: You have no way of knowing the outcome until you give it a shot. The quality of instruction and the level of students' knowledge varies tremendously. Cynthia Harriman, director of the University of New Hampshire Summer Computer Institute and veteran seminar teacher reflects on the intensive format of many software workshops: "By noon your brain is like tapioca pudding." To provide an alternative, the Boston Computer Society and the University of New Hampshire have entered a joint venture to offer low-cost training in more relaxed, week-long sessions.

Some schools offer even longer adult education courses at a comparably low cost. At New York University, for instance, a noncredit, semester-long course in the \$300 range combines 20 hours of hands-on training with reading and lectures.

But even the smallest class may not of-

f-fer much individual attention. If you feel you need intensive one-on-one instruction, your only alternative is to hire a consultant—and pay a consultant's high fee.

CONSULTANTS: ONE ON ONE

"A personable, knowledgeable, and compassionate human," says Sybex Publishing's Rodney Zaks, "is the best computer trainer." If you could obtain a guarantee that every consultant you hire would be this saintly person, it might possibly be worth the \$400 a day that you'd have to fork out for their services. Consultants, however, like seminars, are unpredictable. Even the good ones have bad days. Then there's always the consultant who knows *Framework* inside out but doesn't understand a thing about computerizing your business's inventory control or cash flow procedures.

Andy Bose, senior analyst at Link Resources, a research and marketing firm, imparted some friendly advice: Don't ignore the grass-roots phenomenon. Grass-roots consultants are usually found lurking at local user group meetings, haunting bulletin boards, or burning the midnight oil in front of the corporate PC. These enlightened human beings can sometimes shed a little light on your microcomputer problems, often free of charge, when all your other options have run out.

A NEW METHOD

One new form of training that seems to combine the advantages of several methods is the interactive videodisk.

Interactive videodisk training combines film scenarios, smooth fluid graphics, user interaction, voice, and simulation. Although this self-training method is not yet as affordable as disk-based training, it may soon be.

ASI now has some interactive video courses on the market. The company's demonstration disk required me to interact with the computer about once a minute; just pressing Enter wouldn't do. I watched film clips on a TV screen that showed people performing an operation. I imitated them and even did some creative thinking. I was tested, my scores were cataloged, and I popped around the lessons with a fair degree of personal choice. The videodisk demanded no rewinding or pausing. After awhile I even got it through my head that the purpose of this TV screen, unlike mine at home, was not to put me in some altered entertainment state.

ASI claims that interactive video offers an impressive degree of learning comprehension (comprehension/retention).

Though the cost of producing an interactive video is about the same as for regular video or disks, the hardware required to run it is still very expensive. But someday people may be able to link their home video players to their PCs and take in a few lessons from the "interactive tube."

SHORT CUT TO EASY STREET

No training method yet invented offers a panacea for learning. Different users will find some techniques too slow, some too intensive, and others just right. The best training probably involves a customized blend of materials and a motivated learner. "To become a computer expert you need three things," summarizes Russ Walters, "a computer to practice on, books to refer to, and people to ask questions of." All three resources are in plentiful supply—getting the training you need is just a matter of finding a winning combination. ■

Robin Raskin is a frequent contributor to several computer publications, including PC Magazine. She has written instructional materials for a number of corporations.

SixPakPlus™

The #1 Multifunction Card Now Includes

The Best Multifunction Card Just Got Better.

We've enhanced our SixPakPlus multifunction card with a new extra feature: Borland's SideKick desktop management software. Now you can get the best the industry has to offer together in one package—in 1984 SixPakPlus was voted the #1 multifunction card in PC World's World Class User Survey and chosen as Softsel's Best Selling New Product, while SideKick was selected as InfoWorld's Software Product of the Year.

The Best In Performance.

Over 400,000 satisfied customers will tell you SixPakPlus provides the power for today's demanding requirements, whether you use an IBM® PC, XT, 3270 PC or compatible.

First there's more memory—an additional 64K to 384K RAM—to process more data, or to run today's software programs such as the SideKick multipurpose software we've included. Our extra memory and SideKick's features also work beautifully with your other favorite software pack-

ages like Lotus 1-2-3™, WordStar® Symphony™ and dBASE III.™

Next, more Input/Output ports—one serial, one parallel and an optional game adapter—to add peripherals such as printers, modems, a mouse, plotters or joysticks. Then there's our built-in clock-calendar for automatic time and date stamping.

And we've included another of our "World Class" award winners, SuperPak™ utility software. Selected top in its class for two consecutive years, SuperPak features Super-

SideKick™

The #1 Desktop Management Software

Drive™ which works like a drive but fifty times faster, and SuperSpool™ which lets you print and input at the same time.

The Best in Quality. If the industry's lowest rate of return is a good indicator, then SixPakPlus can't miss when it comes to quality. And we back this dedication to quality with a dedication to service and support. The AST commitment even extends to documentation, with our comprehensive user informa-

tion you'll find SixPakPlus is also the easiest to install and operate.

It takes an industry standard to advance the standard. When you want the best, look to AST's SixPakPlus—with the added value of SideKick software. For more information call our Customer Information Center (714) 863-1333. AST Research, Inc. 2121 Alton Avenue, Irvine, CA 92714 TWX: 753699 ASTR UR.

SIXPAKPLUS FEATURES

- Includes SideKick Desktop Management Software
- Memory Expansion to 384Kb, allowing total PC memory expansion to 640Kb
- Serial port for connecting to a printer, mouse, modem, or other asynchronous devices
- Parallel port for use with parallel printer plotters
- Optional game adapter port—plug in joysticks and other cursor-control devices
- Battery backed Clock/Calendar for automatic time and date stamping
- AST's SuperDisk includes SuperDrive electronic disk and SuperSpool print spooler

THE SMALL BUSINESS DILEMMA:

EMPLOYEE, TEACH THYSELF

Small companies often can't afford computer training facilities, so they rely instead on consultants, one-day training sessions, and employee self-motivation to facilitate learning. Here's how five small businesses handle their training problems.

While most large companies have computer information centers and training specialists, small companies with under 100 employees usually can't afford these luxuries. Of course, some do find creative ways to deal with training, but others just muddle through, not getting the best from their software and hardware simply because no one on staff knows how to use them or has taken the time to learn.

Both time and money influence the way employees in small companies learn about computers. Because of understaffing, no one usually has time to look at training from a general perspective and set a course for the company. As a result, today's training problems are often solved with little concern for tomorrow's problems.

Ironically, employees in small companies typically have greater training needs than those who work for large corporations. Instead of having a specific job assignment, they have varied assignments that require a number of different programs. They have little time to learn many programs, and the task of staying in touch

with all of them on a daily basis is a major problem. When a job must be done on a deadline, employees often do not take time to learn about a new software program because their old ways may seem faster—even though, in the long run, that program might make their jobs easier and more productive. Thus, training is often put off indefinitely as today's work is done.

NO EXTRA TIME

Finding time for computer training has been a problem for Barbara Bossany, pension administrator for Benefit Service Company in Westfield, New Jersey. She and ten coworkers use four IBM PCs for word processing and creating spreadsheets.

The company believes in formal training. If employees find a suitable course, they ask for approval and the company pays the cost. Management usually arranges for employees to take courses at the local computer store from which it buys software. According to Bossany, "Before I went for training on *MultiMate*, I went through its tutorial and was overwhelmed by all the information. They cover so

much, you can't absorb it all. The commands start to make sense only after you start using the program on real jobs."

Bossany claims she cannot learn a new program function by just reading a manual or book. She says that she needs a training course to get her started and then a real-world application before she can take on self-training. For instance, she would not take the time to learn how to use the *Multi-Mate* mail-merge function just for the sake of knowing how. However, when she started on a big job that would go much faster using the mail-merge, she felt justified in taking the time to learn about it.

Complex programs, such as *I-2-3*, that take time to learn and require practice to keep in form can create problems in a small company where the employees have varied responsibilities. While employees may learn to use the program for one job, they often forget the basic procedures if there's a time lapse between jobs.

Benefit Service hired a trainer to introduce its employees, including the president, to *I-2-3*. The trainer did not just talk about the program but also supervised hands-on learning. The trainees worked on a company project so that when they finished, they had completed a real job, not just an exercise to include in a training file.

DEADLY TIME LAPSES

A month after the *I-2-3* training session, the instructor came back to check on everyone's progress. Bossany says she had initially used *I-2-3* for several projects but lost the touch when she didn't use it for a while. "Now when I have a small job to do, I end up doing it by hand. Even if I have a perfect application for *I-2-3*, I don't use it if I want to get something done immediately and don't have the time to relearn the program," she explains.

Training people to use complex programs is an on-going operation. The instructor told Bossany she should spend 15 minutes to a half-hour a day working with *I-2-3* to remain familiar with it, but she does not have the time to do this. Therefore, something obviously went wrong in her training situation. She allowed her *I-2-3* skills to erode because she did not make a real commitment to continuing her efforts to use it despite problems. The training may have been at fault in failing to make

her understand that *I-2-3* is an extremely valuable tool. Had the training given her a real understanding of the program, then while she might have forgotten the exact sequences of keystrokes, she would have been able to look up those details as she needed them. Moreover, Bossany might not have needed retraining if she had been less pressured by a heavy daily workload.

NOT FOR NOVICES ONLY

Not all people who need software training are nontechnical neophytes. Gordon Martin, Ph.D. and president of Martin Acoustic Software Technologies of San

Complex programs that require practice can create problems in a small company where the employees' responsibilities vary.

Diego, California has been in the computer and high-technology fields for over 30 years. His consulting company specializes in solving research and development problems for industrial, governmental, and university research efforts. Despite this background, Martin needs training in order to use new programs.

Like many technically oriented users, Martin does not usually seek formal training from an outside source but instead goes the route of self-tutoring and experimentation. He reads about the new program in manuals and books and experiments on the screen. If he has an insoluble problem, he calls his contacts within the computer community for guidance.

As the dominant software user and developer in the company, Martin learns about most of the programs that his employees use. In addition to reading the manual that comes with every program, Martin also uses books as a source of information. He owns hundreds of computer-

related handbooks, textbooks, and guides.

The size of Martin's staff varies with the number and scope of projects that are underway. He typically has eight full-time employees but, as needed, also hires part-time staff. Not all of his employees use the computer—a PC with a 20-megabyte disk—but when anyone needs to be taught how to use a new program, Martin or his systems programmer does the training.

Martin's technical background allows him to approach each new program with confidence. Although he also takes responsibility for training other staff members, teaching himself will always be his biggest challenge.

PROFESSIONAL ADVICE

J. Richard Fleming, a certified management consultant, owns System Planning Associates, a Westfield, New Jersey company that specializes in giving training advice to small, privately held companies who are computerizing. The company has two Syntex computers dedicated to word processing that Fleming describes as PCs in disguise. He also purchased a Compaq portable because he does a considerable amount of procedure writing and needs to exchange disks with clients' PCs and compatible systems. "My business is the effective use of computers. I know that they won't be used unless the people who are supposed to use them are properly trained," he says.

Although he and his secretary are the company's only two employees, Fleming applies the same rules concerning training to his company as he does to the companies for which he consults. When a new program is introduced to his company, Fleming obtains formal training. He also recommends to his clients what he calls "an initial burst of training from a qualified instructor." He believes you should pay for training. If a store offers free training, it is primarily a presale option and you usually consume these training credits before purchase. After you buy the software, however, the support is often nonexistent. He goes to very few public programs and generally advises clients to avoid them unless he has previewed them.

Fleming suggests three sources for training programs. His first choice is the local computer store where he always

makes organized training sessions part of the deal when buying software. "With a local computer store," he explains, "you have an economic hold. If the training and support are satisfactory, you will give the store more business in the future."

A second source of training is colleges and universities that offer noncredit continuing education courses and seminars attuned to the training needs of the business community. A good third option is commercial computer training centers.

Fleming suggests that clients arrange, whenever possible, personalized training tailored to their company's needs, rather than sending employees to group sessions with people from other companies. With a homogeneous group, the instructor can use examples suitable to the company's business. Ideally, Fleming says, three or four people from a company should go together to the training site. If the trainer comes to the company, the students should be locked in a room away from ringing phones. The constant press of business is a problem in a small company, and people need to get away to concentrate.

FOLLOW-UP SESSIONS

Fleming believes preparation and follow-up are very important if training is to be effective. Before a training program, he spends a half-hour discussing the type of work the office manager and/or secretary does that could be accomplished more productively with the program to be learned. Then he asks his trainees to pick out their two most distasteful operations. During the session, they apply the procedures discussed to these two real-life tasks and ask related questions. Those tasks are the first two projects that they will likely tackle after the training. "When they accomplish something worthwhile with a program, they will be inspired to continue using it," says Fleming.

The instructor who conducted the initial training should return after 30 days for a half-day follow-up session, according to Fleming. In the interim, all trainees should spend at least an hour a day using the program to overcome what Fleming calls the "concern hurdle," the feeling of inadequacy in using a new program. During the follow-up session, the trainer spends time with each employee who took the training.

Students show samples of what they have done with the program and ask questions. The instructor observes what features of the program are most used and refreshes trainees on other features of the software.

Fleming believes that both management and those who will actually be using the programs should take a training session on all new programs, and he does so himself. He says he has taken courses on word processing with his secretary, even though he is not a typist. "Companies should spend the extra money to send the management people to learn about spreadsheet, database, and word processing programs

One surefire method by which a company can get its employees to learn to use computers is to help them to purchase their own machines.

even though they may not use the software themselves," insists Fleming.

Management people are often surprised at how much they use the knowledge they acquire in these training sessions, he says. Even though they may lose touch with how the program actually operates, they can intelligently discuss how jobs are to be done using the program. In addition, if an employee has to be replaced, they can more wisely interview candidates because of their intimate knowledge of the software the person will be using.

Once a core group of employees has been trained, Fleming believes, it has the responsibility to share its skills, thereby combining education and business. But, for the initial training of employees, he suggests an outside facility to ensure that each person is exposed to all the program's features by a capable instructor. In addition, employees should follow up classroom instruction by using disk tutorials. If no tutorial or a poor one is included with a

program, the company should purchase a good one from a third-party source.

Fleming, who has a background in education, has examined the issue of effective training not only from the point of view of getting the job done today but also from a wider perspective. He has targeted preparation and follow-up as essential elements in effective training and has made them part of his personal training program and his clients' programs.

A MASSIVE PC PURCHASE

One surefire method by which a company can get its employees to learn to use computers is to help them to purchase their own machines. To prove its point, AlphaGraphics Printshops of the Future of Tucson, Arizona, which started as a quick printing shop in 1970 and today has 90 employees with three company stores and 120 franchises—as well as 20 PCs and Compaq Deskpros—arranged for a group purchase of the computers at a much lower price than its employees could have negotiated on their own. It laid out the money, and the employees are paying back the amount of the purchase over a 3-year period with no interest. The 14 employees who took advantage of the program chose between the PC and the Compaq Portable and among three printers.

After the computers arrived in September 1984, AlphaGraphics, at its own expense, set up 4 days of training on two consecutive weekends. The company donated two Fridays to the project and employees donated two Saturdays. The training was arranged and conducted in-house by the company's PC expert, who, in turn, called on company employees who were fluent in specific programs as guest speakers. The computer owners used their own computers during the sessions.

Donald Isaacs, vice president of marketing and advertising, purchased a computer through the program and attended the training. "We covered a tremendous amount of information in the two weekends," he says. "After one session, I was able to go home and create a spreadsheet for our family budget."

Employees now frequently work on company projects at home because they enjoy working with their computers. According to Isaacs, "In this company, peo-

ple are willing to work because we treat them as team players. On his own time, an employee in the advertising department developed a program to keep track of our Yellow Pages advertising."

AlphaGraphics employees needed training not just for standard programs but also for the company's special accounting package, adapted by a programmer from an off-the-shelf program. The initial training on this package was provided by the programmer, who has remained available to help out when specific problems arise. From time to time, other consultants are hired to help.

When new employees are hired, they are trained on a one-on-one basis by staff members. "If you have to sit down with a manual or a book to figure out how to use a program, it takes much longer. However, if someone can sit down and work with you, you can cover the same material in a third of the time," says Isaacs.

AlphaGraphics has benefited from helping employees to obtain their own computers. Those who were willing to invest in their own computers have the motivation to make this investment pay off. Both the people who were trained at company expense and the computers they own are resources for the company.

TRAINING TALL TALES

Almost every one of the 45 employees of Iscar Metals, in Hackettstown, New Jersey tells a different story about how he or she learned to use personal computers. The company, a manufacturer of cemented tungsten carbide tools, has two PCs, two XT's, and two Compaq DeskPros that are used for such applications as inventory control, purchasing subcontracting, estimating, pricing, electronic mail exchange and office functions, job costing in the factory, and shop management.

Most Iscar employees who use computers are self-trained, generally by taking advantage of two portable computers that are available for them to take home. Ed Gardner, a purchasing agent, explains, "During the work day, we simply don't have time to learn about a new program and there are too many distractions. I learned how to use several programs by taking home one of the Compaqs."

Gerry Scheyer, vice president, is an en-

gineer who learned to use computers to avoid becoming "obsolete." The company would have bought him a computer, but he decided to purchase his own because he had a number of personal uses for it. Before buying his XT, he hired a consultant to help him pick the best computer for his needs and to teach him how to use it.

The company hired the same consultant to help Scheyer with work-related projects. The consultant comes in about once a week to work with Scheyer and his secre-

Most Iscar employees are self-trained, generally by taking advantage of two portable computers that they may take home.

tary, who are managing electronic mailboxes and communicating by computer with companies all over the world. The consultant helps them with problems and with establishing new procedures. For further training for himself, Scheyer plans to go to an IBM Executive Training Seminar.

Frederick Magro, pricing manager, uses dBASE II and 1-2-3 to calculate manufacturing costs and selling prices. He was exposed to the PC before he came to Iscar but had had no formal training. He learned by using the tutorials that came with the programs and by a process of trial and error. Magro has also learned a lot from reading the computer magazines that are passed around among the employees.

"There are vast areas of computer use I have not tapped as yet. I believe I would progress faster if I could get formal training, but my problem is finding appropriate courses," says Magro.

A DO-IT-YOURSELF PROJECT

Don Block, engineering manager, has been using PC-File to consolidate manufacturing data. His next project is to learn

to use *Symphony*. But because he has no time to do it at work, he is reading a book at home. Charlie Libidinsky, materials control manager, agrees that learning about computers in a small company is mainly a do-it-yourself project. About 2 years ago, his department was so ill-organized that he bought himself a Commodore and a spreadsheet program to ease his frustrations. When he began to spend too much time working at home to organize and generate monthly reports, he asked for a computer, and the company bought him an XT for his department.

"You can teach yourself how to use a computer program," brags Libidinsky. "I'm an example—I did it!" He learned 1-2-3 by reading Que Corporation's book *Using 1-2-3*. And he used *Mastering Symphony* by Douglas Cobb to learn *Symphony* and currently keeps it at hand as a reference book. He admits, however, that he learns by trial and error and has lost a number of spreadsheets in the process.

At Libidinsky's request, Iscar bought a videotape for 1-2-3 training, but he was very disappointed with it. "It was so superficial. I could have learned everything the tape presented by reading the first few chapters of the Que book, and I could get more training if someone who has had extensive experience with 1-2-3 would work with me on a one-to-one basis," he says.

All of Iscar's employees who use computers are constantly teaching themselves more about the software and hardware to which they have access. No one person is in charge of training so the process is not organized. However, human resources are available. Personalities and company policies often complicate issues, but through word-of-mouth, people know whom to ask when they have a problem.

Whether an organized approach is desirable within the confines of a small company is debatable. Those who want to learn to use computers are doing so. Their motivation for learning comes from the desire to do their jobs better. The self-motivation of employees seems to be the most valuable asset a small company can have when computer training is needed. ■

Loretta Holz, author of ten books and many articles, has had extensive experience in computer training.

THE CASE OF THE DISAPPEARING CABLES

Here's a puzzle for you, Watson! Look at this new MicroManager!

Can't say I see anything out of the ordinary, Holmes.

Think, Watson, not about what you see, but rather what you don't see.

But, Holmes, everything seems perfectly in order.

Precisely! When did you ever see a printer station that was perfectly in order, Watson?

Zounds, Holmes! Some rascal has stolen the cables!

So it seems, Watson, but observe carefully—there's more to this than meets the eye. The cables have been cleverly concealed right under our very noses! Notice how each cable disappears through a knock-out hole and enters a channel in the rear of the device. Remove these vertical panels and—voilà!—we discover the cables passing from level to level through secret compartments.

THE
MICROMANAGER
S Y S T E M

Holmes, you've solved the Case of the Disappearing Cables!

Elementary, my dear Watson. But the MicroManager has solved an even deeper mystery—where to put the printer! See how this Basic Floor Unit is actually composed of individual sections—"modules," Americans call them. Consider the possibilities, Watson—single modules used as desktop printer or monitor stands, for keyboard storage, or what-have-you. Combined, they can form any sort of work station we need! The base has locking casters for instant mobility. There's even an optional paper refolding attachment! Cunning, isn't it?

By Jove, Holmes, this new MicroManager is the most diabolically clever device we've ever encountered!

Indeed, Watson. Thank Heaven its creators are on our side!

**Introducing
The Single
Solution To
Many Problems
That Can
Tie Up Your
Personal
Computer.**

Transet 1000™ The print buffer, communications buffer, port expander, printer sharer and I/O switcher. All in one.

Anyone with a personal computer and one or more peripherals has faced the all-too-familiar dilemma. You need your computer to do one important job. But you're forced to wait for the system to finish one job (printing, communicating, whatever) before you can go on to the next one. Or you need to stop what you're doing to switch cables when you want to use another peripheral.

Wait no more. Now Hayes introduces an innovative new device that lets you perform many jobs—at the same time—independent of your computer. Transet 1000. It works with a wide range of systems and configurations. And it allows you to continually expand your system as your needs grow.

Transet 1000 frees your computer from waiting on your printer or modem—so you and your computer can go on to another task. It even lets you print out documents in pre-set formats without having to go back into your computer. At the same time, Transet 1000 can operate unattended mailbox communications—24 hours a day—even if your computer is turned off.

Two computers can share one printer with Transet 1000. Or you can use Transet 1000 to let two computers communicate with each other.

In addition, Transet 1000 is a port expander and software-controlled I/O switcher. Now files can be easily directed and redirected to different peripherals, without physically changing cable connections.

Transet 1000 contains a stand-alone microprocessor, and comes with 128K of memory. It operates with any RS-232 interface computer, and has optional accessory kits available for the IBM® PC and PC XT, Macintosh™ and

Apple® IIc. Kits contain the necessary host cable, a user guide and menu-driven software that lets you graphically set up or customize port

parameters and printing formats. Cables available for IBM PC AT, other computers and peripherals.

Like all Hayes products, Transet 1000 combines sophisticated capabilities with easy operation. Just as Hayes set the standard in personal computer communications, now Hayes is taking the lead in computer task management.

Contact your authorized Hayes dealer to see how Transet 1000 can help you get a lot more productivity

out of your computer system—without tying up your computer or you.

Innovative products for enterprising people

THE CORPORATE SOLUTION:

CLASSES FOR THE MASSES

Faced with a sudden increase in demand for microcomputer training, large companies tend to favor classroom instruction. However, they are finding that courses must be tailored to individual needs in order to be economical and effective.

Tom Wright, a financial analyst, administers pension and profit sharing plans for the corporate division of Pittsburgh Plate Glass (PPG). Although his job description doesn't mention computers, a PC-XT claims the larger portion of his desk at corporate headquarters.

Neither Wright's more than 10 years of experience nor his MBA prepared him for the intricacies of working with computer hardware, electronic spreadsheets, and word processors. His introduction to the PC came in the heat of battle. Faced with the grueling task of calculating the present value of a pension plan for a group of 400 employees, Wright approached a PC-wise colleague in another department. Together they built a 1-2-3 spreadsheet to perform the calculations. Within a day, they had the computer cranking out results—and saved about a week over the conventional calculation procedure.

"The first application started the ball rolling," Wright said. "To learn more, I enrolled in an introductory 1-2-3 class. Now I have 30 to 40 applications on my PC and spend about half of a typical day on

the computer. It really helps increase my productivity."

BALANCING THE EQUATION

Wright is the exception, not the rule. More than one well-intentioned manager has found that combining PCs and people does not automatically raise productivity. The equation requires a critical, seemingly obvious, but often overlooked transitional element called training.

The different approaches to training rival the myriad configurations of PCs themselves. Besides live training in a classroom or seminar setting, there are tutorials (either book or disk-based), video and audio cassette tapes, and individual instruction. All these methods are used to varying degrees, especially in small businesses. Large companies, however, where PCs number in the hundreds or thousands, usually resort to structured classes.

At Pittsburgh Plate, for example, PC education is supervised by Margaret Foote. Ever since 1976, when she built her first computer, a Cromemco, from a kit, colleagues have been coming to her informally for PC guidance. In January 1985,

CORPORATE TRAINING

she officially assumed the title of PC consultant for the glass division.

"The training function is part of PPG's Information Resource Center, a joint project between the glass, chemical, and corporate divisions," Foote explains. "The center provides a central focus for training and other PC-related functions. In the past year, over 250 people have taken classes in PC use including *1-2-3*, *Symphony*, and *DisplayWrite 2*."

A monthly newsletter lists the courses

a technically oriented person how to train other people.

"Second, since PCs are by definition personal, the school should have a machine for each student in a class. The key to learning how to use the computer lies in hands-on doing.

"The last consideration is convenience. Ideally, the classrooms should be within walking distance. For the 2,000 employees at our headquarters, this means downtown Pittsburgh."

Johnston stresses that the primary goal of a workshop is not to teach users the entire operation of a piece of hardware or software, but simply to show them how to get what they need from a given product.

"If a person's job doesn't require graphing," she says, "why waste time teaching it?"

available. Classes range in size from 6 to 20 students: when a class numbers more than 12, an assistant instructor is present to help answer questions.

Besides organizing classroom instruction, Foote calms distraught users, sets up workshops for high-level management, and demonstrates new equipment. Current inventory includes such products as a Hewlett-Packard Laserjet printer, Polaroid Slide Palette, and numerous desktop and portable PCs from IBM, Columbia, and Wang. The need for instruction keeps pace with the steadily growing population of PCs, which currently numbers 500—a twofold increase within the past year. To meet the demand for PC instruction, Foote relies on outside vendors. She estimates that such training costs \$150 to \$200 per day for each student, depending on the subject.

Foote has three main criteria by which she evaluates a training organization. "First," she says, "its instructors must have an educational as well as a technical background. In general, I think it's easier to teach computing to a person with a background in education than it is to teach

TRAVELERS IN TRAINING

One of the first corporations to establish an information center was the Travelers Insurance Company of Hartford, Connecticut. Since its opening in 1982, Travelers's information center has attracted attention from such newspapers as the *Wall Street Journal* and the *New York Times*. It includes a computer store—complete with system specifications and prices posted over each machine—so that employees can try out hardware and software in a retail environment. When an employee selects the machine he or she wants, Travelers buys it for that person's on-site use. More than 6,000 PCs have been purchased for employee use so far, and the company expects to buy 19,000 more by the end of the decade.

Besides supplying hardware and software to in-house customers, the store also organizes training. Last year, over 1,600 employees came to the workshops in the store's classroom, which contains 11 portable PCs and holds up to 20 students (2 to each machine). An oversized display monitor on the instructor's PC allows the entire class to watch the instructor go through

each of the examples step by step.

Joan Johnston, director of the store's operations, recalls that the original computer store did not include a training classroom. "We started with one-on-one sessions," she explains. "One of our staff members, sitting at a PC workstation with one user, would slowly walk the user through the menu of a particular software package, trying this or that, getting in and out of trouble. After a while I found that four or five systems were occupied with one-on-one sessions for the same software package. At that point, it became more cost-effective to do workshops."

Within weeks after that decision was made, the computer store had its own fully equipped classroom, and company newsletters announced the workshop schedules. One-on-one sessions still play a role in training, especially for new products with a relatively small user base. But as the volume increases, group workshops conducted by data processing professionals take over the training.

The workshops have no instructors in the traditional sense. "I prefer the term 'leaders,'" says Johnston, "and the teaching is 'enablement' instead of training. I want to avoid the stereotypes of academic instruction."

Eight leaders now conduct these workshops, which also deviate from traditional seminars in length. "Each workshop is short," says Johnston. "It lasts from 1 to 2½ hours, depending on the subject. You can't remove people from the workplace for several days and expect them to remember everything about a new concept. Furthermore, how many executives can afford that much time away from the office?" Johnston stresses that the primary goal of the workshops is not to teach users the entire operation of a piece of hardware or software, but simply to show them how to get what they need from a product. "If a person's job doesn't require graphing, why waste time teaching it?" she says. "When you need to do graphing, you can find out how through another workshop." If a user still has problems after a workshop ends, the staff follows through with on-site or telephone consultation.

As new programs appear on the market, members of the staff evaluate them. If the store decides to carry a product, Johnston

assigns a leader to "tech up" on the program, then sets up workshops according to demand. Recent subjects included a demonstration of Travelers' *Decision Images* software and sessions on PC use, 1-2-3 graphics, and 1-2-3 data commands. All the workshops are closely geared to the needs of Travelers' insurance business—an advantage over the general courses offered by outside vendors.

Johnston spends much of her time showing the computer store and learning

center to visitors from other organizations, an average 25 presentations a year. Recently, officials from France's Center for the Study of Systems and Advanced Technologies came to Hartford for a look.

TAKING THE INSIDE ROUTE

Though in some companies, PC training is an offshoot of the management information systems department, other companies such as Westinghouse have made it a part of their professional training depart-

ments. Through its training department, Westinghouse Electric Corporation offers 125 courses covering everything from presentation skills to effective writing. Twenty-five of these courses teach PC-related subjects. A similar selection of courses is available to the 120,000 employees of Westinghouse International at any of the company's locations.

Chuck Fritz, manager of professional training at Westinghouse Electric, explains that the Electric division is only one

A FRESH LOOK AT MANPOWER

The need to teach computer skills to thousands of unskilled workers led Manpower to develop a new training technique.

How's this for a training nightmare: You're responsible for teaching computer skills to several hundred thousand unskilled workers. Each student's instruction must be completed within 8 hours. Many of these people will have to be taught in a language other than English. Naturally, costs should be held to a minimum—specifically, less than \$30 per person.

Few professional trainers would volunteer for this job. Yet at Manpower Incorporated, an office temporary agency, a monumental training task like this is par for the course.

According to Mitchell Fromstein, president of Manpower, "Less than a handful of this nation's 18 million clerical workers can operate automated equipment. This situation demands a fresh look at our training techniques."

The "fresh look" resulted in a computer-based training program called *Skillware* that involves no teachers, classrooms, or manuals. *Skillware* functions from a disk. It leads an operator through word processing in a tutorial fashion. Lessons are grouped according to activity such as cursor movement, word wrap, indenting, tab setting, global search,

and so on. A summary concludes each set of lessons, followed by a short quiz administered by the computer. The instruction is self-paced, but most complete the training in about 8 hours.

TERMINAL FRIENDLINESS

Skillware's designers went to great lengths to endow the system with a friendly, human element. The first display, for example, extends the greeting, "Hello Edward!! Welcome to my screen. I'm your IBM PC." Later, when introducing cursor use, *Skillware* carries reassurance to a new level: "You are in absolute control of me, Edward. You can make me go anywhere you want me to go."

Skillware first appeared in 1983, backed by a \$5 million investment. Initial versions were implemented on popular dedicated word processors sold by IBM, Lanier, NBI, Wang, and Xerox, among others. That group now includes the IBM PC with a version for *DisplayWrite 2*. Each of Manpower's 550 domestic offices is equipped with a PC to handle this training. *Skillware* is distributed in English, French, German, and Spanish for Manpower's international offices.

In a sense, Manpower was forced into the role of teacher. "We realized we had to retool our work force somehow, or the market was going to pass us by," says Fromstein.

Over the past year, about 20,000 temporary workers have completed the training. Projections for next year peg that figure at 150,000. To gauge an operator's ability, Manpower has developed a test that assesses speed and accuracy. Any weak areas identified can then be corrected.

THE CHINESE CONNECTION

The company's success has even attracted the attention of the Chinese government. At the request of China's Ministry for Foreign Economic Relations and Trade, Manpower plans to open a training center there. The center will teach Chinese workers how to operate the office equipment—including PCs—that fuels the Western business world.

Meanwhile in this country, Manpower plans to increase *Skillware* offerings on the PC. "We recently added packages for *VisiCalc* and 1-2-3," says information specialist Sharon Center. "In the future, we'll support any software that the business community needs." —Edward Joyce

CORPORATE TRAINING

of Westinghouse's 26 business units. "Since the business units are relatively autonomous," he says, "probably every type of training imaginable is being used. However, our courses are available to any division within Westinghouse."

For PC training, he says, the department usually sets up 10 full-size PCs at a hotel near the offices of the group requesting the course. The 2- to 3-day courses take place in a classroom setting. Two students are assigned to each PC and take turns typing at the keyboard.

Fritz, a veteran instructor of 16 years, believes that two students per PC is better

amount of money companies are willing to commit to training has picked up considerably in the past 6 months," he observed. "Before, management wouldn't hesitate to drop \$5,000 on hardware, \$2,000 on software, \$1,000 on ergonomic furniture, then try to get by with a \$50 tutorial. Now they're realizing that \$300 to \$500 on a training seminar is a good investment when compared to a system's total cost."

Carla Depperman, director of the University of Pittsburgh Computer Learning Center, also values live training. "There are many reasons why most people favor a classroom environment over computer-

sources: academic instructors with strong business acumen, business professionals who like to teach, and private consultants. SAI centers have already been established at the University of Toledo, Wayne State University in Detroit, and the College of Mount St. Joseph's in Cincinnati. SAI's future plans call for expansion into other large metropolitan areas.

The directors of these centers tailor seminars around a company's subject and schedule requirements. At the Pittsburgh center, Depperman emphasizes the curriculum's flexibility and responsiveness, using a course for attorneys as an example. "A local law firm wanted to improve its business with high-tech companies. Its attorneys didn't need to know the operational idiosyncrasies of individual word processors and spreadsheets to accomplish this. So we designed a customized seminar that focused on the concepts, capabilities, and jargon of computing."

Most of the 2,000 students who have attended classes at the center in the past year were enrolled in standard courses offered year round in a classroom equipped with 24 PCs. Classes usually meet twice a week for 4 weeks, or 12 hours of instruction. The curriculum covers subjects ranging from introduction to word processing to Turbo Pascal to computer-aided design. About 70 percent of the participants have the \$165 tuition paid by their employers.

According to Depperman, spreading the instruction over a 4-week period has several advantages. Students can apply what they've learned to problems at the office. The shorter meeting periods mean fewer conflicts with regular business commitments. And the PC-equipped classroom is available in evenings and on weekends during "open lab" periods. These periods allow students to gain extra hands-on experience between regular training sessions, Depperman says.

DIFFICULT DILEMMAS

The problem of large-scale PC education has no single solution. Like many business problems, the answer lies with flexible application of many resources. In general, companies that purchase PCs by the truckload favor classroom seminars and workshops over computer-based training, book tutorials, and audio and video

Companies that purchase PCs by the truckload favor classroom seminars and workshops over computer-based training, book tutorials, and audio and video tapes. However, even classroom instruction presents a dilemma—namely, whether to contract an outside vendor or establish in-house training.

than a one-to-one ratio because the arrangement gives one person a chance to take notes and listen carefully while the other concentrates on the keyboard. Fritz travels about 25 percent of the time and has recently taught PC courses in France and Korea. He added that the courses he and the other nine instructors in the training department teach cost about 30 percent of what the same services from an outside vendor would cost.

BRINGING IN OUTSIDERS

Even companies with highly qualified in-house training groups occasionally turn to outside vendors. Both Westinghouse and PPG contract out much of their training to two organizations located near their headquarters in downtown Pittsburgh: PC Solutions and the University of Pittsburgh Computer Learning Center.

Ralph Burt, executive vice president of PC Solutions, itemized the main functions of his company as software development, training, and executive briefings. "The

based training or book tutorials. First, you can't ask questions of a book or disk. Second, by signing up for a course, you make an overt commitment to attend and complete the work; its structure imposes a subtle discipline not found in self-paced tutorials. Third, since you are physically removed from the distractions and interruptions of the office, you can direct your full attention to learning the subject."

If there's a trend to be spotted in the field of PC training, it lies in the idea of a computer learning center affiliated with an educational institution. The Computer Learning Center is actually a partnership between the University of Pittsburgh and Software Alternatives Incorporated (SAI) of Toledo, Ohio, which has similar arrangements with other universities. SAI provides the expertise to set up a learning center in a short time—approximately 6 weeks—and the university manages it, sponsoring noncredit courses through its continuing education division.

Trainers for the center come from three

cassette tapes. However, even classroom instruction presents a dilemma—namely, whether to contract with an outside vendor or establish in-house training.

Outside vendors tend to offer a robust curriculum. Their trainers make a living by staying abreast of the technology. When it comes time for a course in a new product, they generally have an instructor ready.

Having fully equipped classrooms is another point in their favor. Outfitting 20 PC workstations with printers, color monitors, and software can be an expensive proposition—one that some companies would rather avoid.

In-house training, on the other hand, guarantees control over the course. Employees who attend a spreadsheet class, for example, learn not only how to tally numbers in hypothetical situations at the Widget corporation but how to apply those calculations to problems found in their own businesses.

When a company has a vendor tailor a course to its specifications, control often extends to the choice of instructors, too. One company official tells of a situation where the instructor scheduled by an outside vendor became ill. "The vendor substituted a programmer to teach an introductory course to an audience of eight marketing directors. His presentation was so steeped in technical jargon that he lost the entire class in the first hour. We had to ask for a replacement in the next session."

ANOTHER ANSWER?

Of all the training options, the least expensive may be one of the most effective. It involves no instructors' salaries, does not disrupt the normal flow of business, and works equally well at all levels from executive vice president to mailroom clerk. Employees start out with the highest motivation, learn at their own speed, and receive comprehensive hands-on instruction. This miracle is an employee PC purchase plan, which offers the company's corporate discount rate to employees who buy PCs for personal use. Although less methodical, this type of training is effective. After all, few seasoned PC owners enroll in introductory computer classes. ■

Edward Joyce is a free-lance writer based in Virginia.

You erased your cost analysis. Get it back with The Norton Utilities.

It happens. Maybe you type a slash instead of a period. Maybe you press delete when you don't mean to. One slip of a finger and a whole week's worth of input data is history. Relax. I can help.

I'm Peter Norton. The Norton Utilities are powerful organizational tools with a remarkable file recovery capability called UnErase.™ With the UnErase feature, you can bring back files you'd given up for lost, just by entering a few simple commands.

ORGANIZE YOUR DISKS

The Norton Utilities are practical disk management tools, too. You can use The Utilities daily to locate files, track down your data and put disks in order. Hard disk helpers,

I call them. For diskettes, too.

NEW! IMPROVED!

I've just introduced The Norton Utilities Version 3. It has lots of new features, plus complete hard disk support. Designed for the IBM PC and DOS compatibles.

Available at Computerland and other dealers. Or order direct for \$99.95 from me: Peter Norton, 2210 Wilshire Boulevard, Santa Monica, CA 90403. 213-399-3948.

Mastercard and Visa welcome.

Got an old version? Upgrade to Version 3 for \$25. Got a pirated copy? Go legitmate: Get the new version and your own manual for the upgrade price. Just send a check and your old disk.

DOING IT YOURSELF:

A BLUEPRINT FOR TRAINING

Creating a specialized training program for your company isn't as difficult as it sounds; all it requires is the right kind of planning and organization. This do-it-yourself guide to computer training development gives you nine practical steps to follow.

Company 1 needs to train its employees to do word processing with *MultiMate*, in conjunction with its individualized company correspondence forms. Company 2's employees must learn to use its new custom inventory system. Only tailor-made microcomputer training programs will fit the bill for both companies.

The need for training tailored to particular organizations, tasks, people, or situations has prompted more and more corporate professionals to take on the development of PC training internally. Often the responsibility falls on individuals with no real training experience or expertise. With careful planning and the nine steps outlined here, however, practically anyone can budget, conceive, and execute a training program that looks good, runs well, and teaches exactly what the company wants its employees to learn about using the personal computer.

THE NINE STEPS

Ideally, developing your own PC course is a nine-step process. You must:

1. Determine the training need and identify your audience
2. Evaluate the resources
3. Plan and price the best program choice
4. Gain management support and funding
5. Determine and review the scope
6. Create and review the design
7. Complete and review the course
8. Test and fix it
9. Evaluate the results.

In large organizations, the order in which these nine steps proceed may depend on committee input, written requests and justifications, and formal channels of approval. In smaller companies you may find yourself in the position of doing all the planning and approving yourself, on your own time lines, with the steps guiding your activities informally.

DOING IT YOURSELF

IDENTIFYING THE NEED

Determining the training need and identifying the target audience (step 1) is the most crucial step. An educationally sound and technically accurate program that meets no one's needs is simply a waste of resources. You must target the PC training

training effort.

Getting others' opinions will prevent you from applying training skills needlessly to a problem that doesn't require them. For example, one company found that there was a good deal of resistance to implementing a PC-based inventory tracking

resources at this time, but you want to know where you can get advice.

If you are part of a large organization, internal resources (like a training department or an information center) may be able to lend some support. Regardless of your company's size, resources like magazine articles, business associates, professional organizations, and books can always be helpful.

If your experience with PCs and training is not strong and you lack the resources you need, a good consultant can help you avoid costly mistakes. If you need to shop for consulting expertise, look for a person with PC training experience, solid references, appropriate work samples, and concern about your needs as well as one you can work with well.

Also, consider carefully what the consultant is selling. Some consulting groups offer a range of services including planning support and training development in a wide variety of media. Some are willing to recommend alternatives that meet your needs even when that recommendation may mean less business for them. Other firms sell one solution and don't pay much attention to your situation.

Don't feel that you must rush into a lengthy or expensive consulting contract. You can opt to hire the consultant for a minimum number of hours, get a feel for how he works, and then make a larger commitment.

PLANNING AND PRICING

When you're planning and pricing the best training alternatives (step 3), you'll want to consider the most-efficient means of training development and delivery as well as the most-effective media to use.

Staff availability and expertise are usually the deciding factors when determining whether to involve internal staff or consultants. If you venture into a new training media (like video disk), you can hire an experienced consultant to hold your hand through the first project. After gaining some experience, you can determine whether to make an investment in an internal staff development team.

When you choose among the various forms of training media available, consider whether the trainees need a conceptual introduction (video is good) or require

After evaluating the training need and the target audience, your next move is to identify the resources that are available to you. Creating PC training programs requires a combination of PC knowledge and training expertise. Evaluate where your strengths lie and seek the professional help you need.

to address a real training need and at a level appropriate to your audience.

Regardless of the size or formality of the approach, you should always state the training need in the following terms: What are the problems in integrating PCs into the workplace? How can you solve them through training? How can solving the problem significantly improve the company's functioning?

Then test the validity of your stated training need. If you're the only one who thinks "everyone else" needs training, you may not be on the path to success. Look at these two examples:

Company A's training need: "Managers do not know how to use the *Symphony* template to complete variance reports. If they learn to do so, the variance reports can be in a consistent form for automatic compilation." Describing this need clearly to employees throughout the company should provide you with useful feedback that either supports or questions the validity of the effort.

Company B's training need: "For more efficient use of top managerial resources, we need to train our management ranks to use personal computers." This training need is too general. Good intentions are hard to argue with. But training needs must be specific to help you gain the advice or support you need and to help you direct the

system. Its managers assumed that training would cause the resistance to subside. The staff was trained, and the system was installed, but a high number of system errors revealed that problems still existed. When they investigated, management found that the resistance didn't stem from a lack of education, but from the misconception that the inventory system would change or eliminate some jobs.

If a legitimate training need exists, assessing your audience is a factor equally as important as analyzing your training need. For training to be successful, you must be familiar with the audience, and you must be prepared to meet its needs. You should be able to answer these questions: How many people need training? Where are they located? How much do they already know about the PC? What PC-related skills do they have? What education have they had? What do they do on the job? What will they be doing with PCs?

EVALUATING YOUR RESOURCES

After evaluating the training need and the target audience, your next move is to identify the resources available to you (step 2). Creating PC training programs requires a combination of PC knowledge and training expertise. Evaluate where your strengths lie and seek the professional help you need. You don't need to secure all the

hands-on experience (try a diskette-based course or a classroom workshop). After you identify two or three possible media, compare their costs, taking both development and delivery costs into consideration. For example, self-instructional training may require a large investment up front for video equipment, workbooks, or software development. And an hour of diskette-based training may consume 300 to 500 hours of development time.

If you do not want to program the course from scratch, an authoring system may be the answer. These systems create an environment in which nonprogrammers can create training software. (See accompanying sidebar for a list of available authoring systems.)

Once developed, self-instructional training courses are inexpensive to deliver,

and most can be reused. Diskette-based courses are especially useful when you need to give hands-on experience to a widespread population.

Classroom training, complete with hands-on activities, can cost less to develop than diskette-based courses, but the delivery costs for labor, hardware, and software can be high.

To compare the costs of different alternatives, use these calculations:

- For development costs, add labor involved in development plus travel plus equipment (supplies, hardware, and software).
- For delivery costs, multiply cost of student per hour by number of hours students will be in training; add cost of student travel; multiply by number of students; and add cost of instructor labor and travel plus

cost of facility plus equipment.

In addition to considering the costs of your training program, look for possible quantifiable benefits. Will the PC training help reduce or prevent other expenditures? Quantifiable benefits can be viewed as offsetting the overall costs of development and delivery of the training.

Training itself may represent a source of revenue. If your training program is generic enough to interest people outside your company, consider marketing the product through a large PC-training vendor. Several of the companies selling diskette-based training will gladly consider commercial distribution of courses that have been developed by corporations for their own use. Having a training vendor sell your program could offset some of the expenses incurred in its development.

PC CONNECTION®

PC Palace.

A man's phone is his castle.

Whether you call up on our toll-free number, or tool up in your private coach, PC Connection will roll out the red carpet. Because here under the majestic skies of Marlow, NH (pop. 547) we're offering a regal selection of PC add-ons and software at prices even a pauper can afford. Backed by warranties and support services as solid as the crown jewels.

My kingdom for a DOS.

You know the feeling of power you have when you first get a PC? You can do anything! In no time at all! Better than you've ever done it before! It's like being sixteen again.

But after a while, the novelty wears off. Things get ordinary. It's time to conquer new lands, learn new languages. It's time to call PC Connection. We'll make you feel like queen (or king) for a day.

Because our job is to figure out

how you can put your PC back on a pedestal without spending a king's ransom. We've checked out those new integrated software packages, we've tried those new printers, we've micro'd to mainframe, moused to menu, and modemmed to more mailboxes than most might mention.

On your knees, bees.

When you call us, you not only get honest advice, you get some very sweet deals. Like the vessel of pure New Hampshire royal nectar we're sending free to everyone who places a \$500 order between now and August 30.

Just call 1-800/243-8088 or 1-603/446-3383, M-F 9:00 to 9:00; Saturday to 5:30. If you're planning to visit, call ahead to make sure what you want is in stock. The showroom closes at 8:00 M-F and at 5:00 on Saturday.

A container of PC Connection honey, featuring our most hair-apparent mascot. Free to all customers, but not commercial accounts. Limit one per customer.

For the IBM-PC (XT & AT) exclusively.

PC CONNECTION

Plan for jr's tomorrow, today.

Stay calm, all you junior owners. Get away from that window. Put that bottle back in the medicine cabinet. The worst thing to do in a crisis is panic. Instead, call up one of our trained and sympathetic support people at our junior crisis control hotline 1-800/IBM-jr-PC. They'll talk to you about the hundreds of upgrades and software that we have available to give you years of creative computing with your PCjr.

The price list you see here shows

many (but not all) of the products we have for the PC, XT, AT, and PCjr. But we also have a complete price list full of nothing but junior-compatible products. If you don't have one, call us and we'll send it right out.

If you've ever ordered from JR. CONNECTION or have ever in the past requested we send you a price list, then you will automatically receive our most up-to-date price lists in the mail.

AST Research (For IBM-PC or XT)	
All AST Boards come with SuperDrive SuperSpool and one year warranty	
SuperPakPlus 64k upgradeable to 256k, with clock calendar serial and parallel ports (game port optional)	249

PC Connection Hardware Special

expires August 31, 1985

HERCULES COMPUTER

Monochrome Graphics Card

- Allows production of graphics on monochrome monitors with programs such as 1-2-3, Symphony, Framework, and Microsoft Word
- Runs both text and graphics
- High resolution 720 x 348
- Has parallel port
- Reliable, 2-year warranty
- Free patch is available directly from Hercules that enables the card to run Flight Simulator \$285

OUR POLICY

- We accept VISA and MASTERCARD
- No surcharge added for charge cards
- Your card is not charged until we ship
- If we must ship a partial order, we never charge freight on the shipment(s) that complete the order
- No sales tax
- All shipments insured, no additional charge
- Allow 1 week for personal and company checks to clear
- UPS Next-Day-Air available
- COD max \$1000 Cash or certified check
- 120 day guarantee on all products *
- To order, call us anytime Monday thru Friday 9:00 to 9:00, or Saturday 9:00 to 5:30. You can call our business offices at 603/446-3383 Monday thru Friday 9:00 to 5:30

SHIPPING

Continental US: For monitors, printers, and drives, add 2% for UPS ground shipping. Call for UPS Blue or UPS Next-Day-Air. For all other items, add \$2 per order to cover UPS shipping. We will automatically use UPS 2nd-Day-Air at no extra charge if you are more than 2 days from us by UPS ground. **Hawaii:** For monitors, printers and drives, actual UPS Blue charge will be added. For all other items, add \$3 per order. **Alaska and Outside Continental US:** Call 603/446-3383 for information

DOING IT YOURSELF

MANAGEMENT SUPPORT

After you determine the best training alternative and justify the cost, you must secure both the support of management and the necessary funding (step 4).

By this time, you've probably gained a sense of where management stands on the issue prior to this step, but now is the time of reckoning. Be prepared with the need statement, costs, and benefits. If you are planning to use a new training media (like interactive video or computer-based training), you may want to have a demonstration available to show the decision makers.

With the plans and approvals behind you, you can begin to develop the training: you'll determine and then review the scope of the program (step 5).

Regardless of the media you decide to use, the scope should include the overall purpose of the training, an audience description, measurable training objectives, an outline of the training topics, time lines for completing milestones, and a list of the

The true test of training success is in the final evaluation. Ask all students to complete a questionnaire describing their reactions to the training program.

resources that may be required.

The individual responsible for developing the training determines the scope, which is then reviewed by those responsi-

ble for the success of the training. Reviewers should include managers, users or trainees, PC experts, and training specialists. The mix of experience helps ensure that the training is technically accurate and educationally sound, and meets the students' needs. It also helps secure management's endorsement.

DEVELOPING A DESIGN

Next, you should develop a draft of the training design based on the reactions to the scope (step 6). For computer-based training this design will include paper drafts of screen layouts complete with student input options, screen branching information, and student feedback messages. Video program designs may be as specific as a draft of the dialogue and visual drawings or as general as a detailed outline with visual suggestions. Classroom course designs should include course content outlines, hands-on activities, and visual aids.

The review panel should carefully

study this document to reach an agreement on how the software will look once it is developed (step 7). They should consider such questions as: Will the course be technically accurate? Will the course teach? Are the learning objectives achieved? Careful review at this point saves you costly software changes later.

Some companies like to hold a walk-through of the design. In effect, each part of the training is presented, discussed, and approved by the course developer and the reviewers.

Barring unforeseen problems with the design, you complete the final training on the basis of comments from the design phase. At this point, each reviewer should participate in the training as a student. While involved in the training, reviewers should consider their own areas of expertise or concern (like PC technical knowledge), but they must also keep in mind the needs of the trainees. Any specific suggestions for changes should be identified at this point.

Once the training is complete, you should test it with a sample group to help iron out any remaining bugs (step 8). Testing may involve gathering student observations and reactions. After successful testing, you can put the training program into widespread use.

If the student population is so small that you can't form a test group, ask one or two trainees not involved in the development process to review the completed training. You'll want all the impartial feedback from them that you can get.

THE FINAL TEST

The true test of training success is in the final evaluation (step 9). Ask all students to complete a questionnaire describing their reactions to the training program. You should also evaluate the student's ability to perform the measurable objectives that were part of the training design. And eventually managers and other supervisors should be able to tell you whether employees under their review got what they needed from the training.

When the PC training you need is not available commercially, follow this step-by-step plan and do it yourself. By designing your own training program, you can be sure to meet your specific needs. ■

CopyWrite backs up IBM PC Software

Hundreds of the most popular copy-protected programs are copied readily. **CopyWrite** needs no complicated parameters.

Requirements: IBM Personal Computer or XT.
128k bytes of memory.
one diskette drive.

CopyWrite will run faster with more memory or another drive.

CopyWrite is revised monthly, to keep up with the latest in copy protection. You may get a new edition at any time for a \$15 trade in fee.

CopyWrite makes back up copies to protect you against accidental loss of your software. It is not for producing copies for sale or trade, or for any other use that deprives the author of payment for his work.

To order **CopyWrite**, call with your credit card or mail a check for \$50 US funds to:

Quaid Software Limited

45 Charles Street East, Sixth Floor
Toronto, Ontario, Canada M4Y 1S2
Telephone (416) 961-8243

Ask about **ZeroDisk** to run copy-protected software from a hard disk.

FIVE REASONS TO BUY THE AT&T PERSONAL COMPUTER IN 1985:

1. 1986
2. 1987
3. 1988
4. 1989
5. 1990

There are lots of reasons to buy the AT&T PC for your business this year. It offers more computer for the money. It's faster than the IBM PC, and has superior graphics. The AT&T PC is a hardworking, high-performance computer designed to meet all your immediate needs.

And it has something more. A commitment to your future.

That commitment can be seen in our new enhancements. They include the Communications Manager with simultaneous voice and data transmission, the 8087 co-processor which speeds mathematics computing up to 100 times, and a display enhancement board for even better color graphics.

That's just the beginning for the AT&T PC, and the starting place for a fully integrated office.

THE COMPUTERS WITH THE FUTURE BUILT IN

Because AT&T PCs can be linked together in small groups through the STARLAN local area network or networked into an entire system with the AT&T Information Systems Network.

In fact, wherever your needs take you, with the AT&T PC you know that your growth path is clear, and that you'll have plenty

of options. That's what gives us the edge over our competition. And you the edge over yours.

It's what makes the AT&T PC the right choice this year, next year, and in the years to come.

For more information, call your AT&T Information Systems Account Executive, visit an authorized AT&T dealer, or call 1-800-247-1212.

The right choice.

SURVEYING THE RESOURCES:

A 1-2-3 TRAINING COMPENDIUM

Bedazzled and befuddled by the array of resources available to help you learn Lotus's 1-2-3? PC Magazine takes you on a guided tour of the various 1-2-3 training aids, including books, disk-based tutorials, audio and videotapes, and seminars.

A mind-boggling number of training products are available to help you learn specific software programs. To give you an idea of the scope of the marketplace, PC has targeted one piece of software for which many users seek outside training: Lotus's 1-2-3. Here are 21 reviews of books, disk-based tutorials, audio and videotapes, and seminars that represent the spectrum of 1-2-3 training aids.

HARDCOVER HELP

More than most authors would care to admit, you do judge books by their covers or, at least, by their visible differences. If this were not true, you'd have a hard time choosing a book to teach you 1-2-3. Of course, if you could spend a few days flipping through your neighborhood bookstore's shelf full of books on 1-2-3, all of which

cost under \$25, you'd probably make a wise choice. But, how can you make a competent decision in 10 minutes or less?

In the course of reviewing six books that purport to teach 1-2-3, I found several cues that you can look for to help you make a good selection while browsing. First, look at size and price. I discovered that the two least-expensive and most lightweight books were also the least helpful, while the two that appeared densest were packed with useful content. By reading the preface, you can tell whether a book claims to be comprehensive or is just a beginner's guide. While I'd probably opt for the former because I believe it's better to learn from a book that will also serve as a reference tool, you may prefer a book that covers not as much, a bit more quickly.

A glance through the book will tell you whether it relies on examples or explanations. Example-oriented books have a lot of step-by-step instructions, and a quick examination of the screen illustrations will

show that the same problems are developed over many pages. Such books rely heavily on your actual manipulation of a sample spreadsheet while they describe what's going on, and so they are hard to use if you don't want to sit at a computer with 1-2-3 while reading them. In other words, they aren't good books if you want to read at home but your computer is at the office. The explanation-oriented books, while they often include a lot of examples, tend to be written in paragraphs of real prose.

Check to see how much the book is oriented to the structure of 1-2-3 itself. Does

tant in a training book is its typographical and stylistic conventions. Is it always clear what you are supposed to type in versus what the computer will display? Is there a clear distinction between the words you are supposed to type and the labels of keys you are supposed to strike? In this area, authors should not be creative; they should be consistent.

To judge the quality of the books in some sort of systematic fashion, I asked myself what features of 1-2-3 confuse or confound new users the most. With the help of two professional 1-2-3 trainers, I identified the most-difficult concepts and

cal size of the printer page?

- Horizontal and vertical lookup tables. Does it explain them clearly and describe their limitations?

- The Data Table 1 and Data Table 2 commands. Does it explain these "killer commands" clearly, both as to function and as to when they are appropriate?

- Extraction of records from a database. Does the book clearly explain definition of ranges?

- Macros. How well does it describe the usefulness of macros and the techniques for creating them successfully?

THE CREAM OF THE CROP

Using 1-2-3 and Lotus 1-2-3 Self-taught offer the clearest and most-complete descriptions. They are the only books that give serious advice on memory management, mention that lookup tables cannot be used to convert numbers into text equivalents, and describe both step-by-step debugging and auto-execution in conjunction with macros. They also include the best explanations of 1-2-3's date handling and record extraction features.

On the easy-to-judge-in-the-bookstore front, Using 1-2-3 and Lotus 1-2-3 Self-taught both list all 50 or so 1-2-3 @ functions in their indexes. They follow the most intelligent and transparent typographical conventions; they clearly distinguish between keystrokes that represent commands, characters to be typed into a spreadsheet, and special keys. Both books are good basic training tools and would serve well as handy reference companions to your 1-2-3 manual.

Using 1-2-3, the oldest of the books covered here, is the only one with extensive references to that prehistoric spreadsheet program, VisiCalc. If you are only just now making the VisiCalc-to-1-2-3 conversion, this is without a doubt the best of these books.

The book is organized like 1-2-3 itself and gives full descriptions of commands and functions. The many examples illustrate the topics discussed, but they are not the focus of each discussion. Typographic and style conventions are usually helpful. More than most of the books reviewed here, Using 1-2-3 draws attention to the limitations of the program, particularly in the database area.

it introduce commands in order of complexity and describe groups of commands that are related to one another within 1-2-3? Books with such an orientation, which also tend to be the more comprehensive ones, are useful as long-term references. Other books are more problem-oriented: they explain a problem for which 1-2-3 might be used and then describe all the commands that you can use on that kind of problem, whether or not 1-2-3 considers the commands closely related. This method can be confusing, especially if you go back to the book a month later for a bit of additional information on a feature you haven't yet used.

Finally, one feature that is relatively easy to judge and is extraordinarily impor-

tant in a training book is its typographical and stylistic conventions. Is it always clear what you are supposed to type in versus what the computer will display? Is there a clear distinction between the words you are supposed to type and the labels of keys you are supposed to strike? In this area, authors should not be creative; they should be consistent.

- Memory use. Does the book warn about 1-2-3's memory limitations and give any advice on minimizing memory occupied?

- Date manipulation. Does the book clearly distinguish between loading a date into a cell, the way the date is stored in the cell, and the way to format a cell so the date is properly displayed?

- Printing commands and output formatting. Does the book make the function of printer border rows and columns, headers, footers, and setup codes completely clear? Does it adequately describe the relationship between the page size and margins known to 1-2-3, and the actual physi-

Lotus 1-2-3 Self-taught looks better the longer you study it. At first, it appears somewhat pedantic, but the writing style, if never sparkling, is always clear and respectful of the reader.

Self-taught's typographical conventions are the clearest of any in this collection, although the overall look of the book is unexciting. (Reproductions of graphs, in particular, are poor.) The coherent descriptive text is broken up with numerous "beware" and "how to" passages. Like *Using 1-2-3*, *Self-taught* is structured like the program itself and progresses from elementary to complex commands in a clear and logical fashion.

Self-taught covers most of 1-2-3's most difficult concepts and commands with admirable lucidity. However, its description of data tables is a little weak, and although its basic description of macros is fine, it is in the final chapter of the book and reads like an afterthought.

THE SECOND STRING

The *Osborne/McGraw-Hill Guide to Using 1-2-3* and *The ABCs of Lotus 1-2-3* both expect you to hang on the keyboard as you learn. Neither book would be much use if you were not prepared to follow their

examples in some detail. Both look, at a glance, like manuals or textbooks. They are not easy to read; rather, they are meant to be used. The *ABCs* publisher made its book even easier to use by making it spiral-

Lotus 1-2-3 Self-taught looks better the longer you study it. At first, it appears somewhat pedantic, but the writing style, if never sparkling, is always clear.

bound, so it lies flat when it is opened; this, presumably, explains why it costs more than any of the other five books.

Neither book attempts to be comprehensive—the *Osborne/McGraw-Hill Guide* only covers 17 of the 50 @ func-

tions and *ABCs* explains even fewer. In a section-by-section comparison, these two books lack uniformity; they often, but certainly not always, offer very good descriptions. Either one would make a good learning tool to be used alongside the computer, but neither is likely to be especially useful as a long-time reference book.

The *Osborne/McGraw-Hill Guide* is clear and well-written and is conversational without being chatty. The book's typographical conventions are good. And it claims to be "wholly dedicated to the learn-by-example approach," although it doesn't carry this approach to extremes. It mixes extensive at-the-keyboard sample problems with explanatory text, and even though you would learn more by working right through the examples, you can easily check on a command or grasp a new feature of the program by reading the text.

The book covers the major subject areas quite well, but, in a couple of cases, the explanations are a bit hampered by the author's insistence on relating them to the sample problem at hand.

The *Osborne/McGraw-Hill Guide* pursues the subject of building large systems with 1-2-3 much further than any of the other books and includes chapters on creat-

ing database input and output forms using 1-2-3 macros, building a stock-tracking system, and using 1-2-3 for financial functions and sensitivity analysis.

The ABCs's subtitle, *A Step-by-Step Approach*, is an accurate description. It is also the book's main flaw: If you don't want to march in lock-step with the book, its usefulness plummets. Examples are everything in this type of book, and unless you set them up yourself, you will find it difficult to learn much of anything.

The ABCs of Lotus 1-2-3's subtitle, "A Step-by-Step Approach," is an accurate description. It is also the book's main flaw: If you don't want to march in lock-step with the book, its usefulness plummets. Unless you set up the examples yourself, you will find it difficult to learn much of anything.

The book also has poor typographic conventions. 1-2-3's command structure allows you to give such a command as Worksheet Global Recalculation Manual by simply typing the first letter of each word: WGRM. Unfortunately, that's all ABCs tells you to do. When every other book I reviewed instructs you to issue such a command, it spells out the whole thing and uses typography, such as boldface or italic, to indicate that only the initials are required—an approach that takes up more space but for a good cause—it's much more meaningful.

ABCs does not adequately explain data and data table features. In fact, its description of the @ (auto-execute) macro is incomprehensible. And its suggestion that if you really want to use macros for programming, you should read some books on BASIC is a cop-out. ABCs covers the complexities of printing at least as well as any other book, and it is the only one with extensive information on how to configure 1-2-3 to various printers and plotters. In general, ABCs is better equipped to tell you how to do things than to explain why you might want to do them.

TWO LIGHTWEIGHTS

Working with 1-2-3 on the IBM PC and Compatibles and *1-2-3 Go!* are the least expensive, shortest, and least useful of the books I reviewed. Both attempt to organically describe 1-2-3: they take problems and quite simply discuss how you might tackle them with 1-2-3. Consequently, they are organized rather less clearly than any of the others. Both ask you to set up and manipulate a variety of 1-2-3 models as you read, but, to a greater extent than

with the previous pair, you can get away with not doing so.

At first glance, *Working with 1-2-3* looks promising. Because the author's style is lively and the table of contents looks good, you will be inclined to believe that perhaps this stuff really can be explained in only half as many pages as most books give it. But the more you look at *Working with 1-2-3*, the less you'll like it. After a few chapters, even its lively style becomes pretty annoying.

Overall, the book is an adequate introduction to some of 1-2-3's abilities. Unlike many other books, it considers database and spreadsheet features to be tightly interrelated and presents examples that illustrate the connection. Its description of Data Table 1 is good. But it covers record extraction, horizontal and vertical lookup, and macros in a cursory fashion.

Working with 1-2-3 is a lot easier to read away from a computer than most of the others. But the book doesn't cover enough areas in detail for you to learn about 1-2-3 from it. It makes no mention of memory management or date functions, except for @TODAY. In addition, it inad-

equately covers printing in a single paragraph. And, finally, its core section—a long chapter entitled "The Artistic Approach to Spreadsheet Creation"—promises some guidance on how to lay out and design complex spreadsheets but doesn't deliver.

1-2-3 Go! covers the basics of 1-2-3, and, like *Working with 1-2-3*, takes a more integrated view of the role of database and spreadsheet functions than do most of the other books. It is worth buying only if none of the other books are available.

Horizontal and vertical lookup tables are nowhere to be found. The book covers print commands in a cursory two pages and doesn't describe any of the /X macro commands, except for /XM, which is not much use without the others. However, I will admit that it is possible I missed some of the features of the book, and you may too, especially since its index is the shortest and least comprehensive of them all.

1-2-3 Go! never raises memory management issues, and it sets up the sample spreadsheets in an unnecessarily memory-wasting fashion. Its typographical and style conventions are poorly thought-out. And its example screens were produced by dumping screens to a low-quality dot-matrix printer—not an adequate method for reproducing them in a book.

Some books can do an admirable job of teaching the use of a complex program like 1-2-3. But, just as in any other field, the quality of the current crop is uneven. The good news is that none of them cost so much that you will sorely regret the purchase, and none of them will take you seriously astray.—John Helliwell

John Helliwell, a computer consultant and writer, is based in Toronto.

DISK-BASED TRAINING

You would think that the transparent command structure of 1-2-3, its extensive help screens, and the inclusion of an on-screen tutorial in its package would have discouraged third-party vendors from creating disk-based 1-2-3 tutorials. Well, you'd be wrong. The disk-based tutorial market for 1-2-3 is both large and thriving.

Disk-based training programs might

seem like the ideal way to learn a new software package for many reasons. They are in the same medium as the package itself; they're state of the art, menu driven, interactive, and all the other buzzwords; and because most of them attempt to simulate the real program, your graduation to the real thing should be a snap.

Yet disk-based tutorials have severe drawbacks. The simple act of transferring training text from a book to a screen doesn't make the material any more comprehensible if it isn't easy to understand in the first place. The programs must be interactive, preferably instructing you to enter the keystrokes that you would use when actually working with *1-2-3*. But since the training programs expect specific keystrokes to be executed, they usually tolerate no deviation from the instructions. The field of on-line tutorials is still only in its infancy.

Most disk-based training programs for *1-2-3* attempt to mimic an actual *1-2-3* session—an advantage of disk tutorials that a mere book cannot approach. Graduates of these training courses should be able to jump right into the real thing and say, "Hey, I've been here before." As important as the visuals is the feel of the program: the relationship of screen responses to keys being pressed.

Lotus's own *Tutor* program excels at *1-2-3* simulation, mainly because it's not a simulation at all. The program is actually a somewhat modified version of the real *1-2-3*. However, unlike *1-2-3*, *Tutor* loses keystrokes if you type too fast. The program apparently clears the keyboard buffer after it accepts each keystroke.

SPLIT-SCREEN APPROACH

Similar to *Tutor*, the Cdex *Advanced Training for the Lotus 1-2-3 Program*, the ATI *Teach Yourself Lotus 1-2-3*, and the ASI *Productive Application of Lotus 1-2-3* all use the split-screen approach—that is, they have a simulated worksheet on top and tutorial information and keystroke instructions on the bottom. If more text is required, the tutorial takes over the full screen.

These three tutorials aren't very successful in simulating the feel and rhythm of the real thing. None of the training programs, except for *Tutor*, comes anywhere

close to the speed of *1-2-3* or can show the worksheet actually scrolling, although the ASI program does attempt it and is almost successful.

Cdex's *Teach Yourself Lotus 1-2-3* looks almost exactly like *1-2-3* (except that it's entirely white on black with a color display) and, unlike the others, uses the whole screen for the simulated worksheet by putting its instructions in boxes overlaying the worksheet wherever convenient. But the feel of *1-2-3* is largely absent. For

only program I reviewed that writes directly to the display memory and gives instant screen updates.

DISK FANTASIES

Imagine a training program that tells you how to do something, lets you try it out, and then explains why you ran into problems. It also gives alternative methods and allows you to use whichever one you choose. At some point, you'd be more or less on your own to move around freely

instance, when the tutorial asks you to press the left-arrow key four times, the cursor doesn't actually move until you press all four keystrokes. *Teach Yourself* is a compiled BASIC program and is painfully slow and bulky. Just about every keystroke generates another disk access. The screen is frequently erased and redrawn. Although the screen has an uncanny resemblance to the actual *1-2-3* spreadsheet, it doesn't behave much like it.

The Houghton-Mifflin *DoMore with Lotus 1-2-3* doesn't even attempt to simulate *1-2-3*. Although pieces of a spreadsheet are occasionally reproduced on the screen to illustrate the lessons, you can't actually do anything with them. When the tutorial explains how to select a range, it does so well, but all you do is press Enter to go to the next screen. Yet *DoMore* is the fastest of the lot. Aside from *Tutor*, it is the

and experiment, but the training program would figure out what you were trying to do and give you helpful suggestions along the way.

Unfortunately none of these programs live up to this fantasy. One of the major drawbacks of disk-based tutorials is their lack of flexibility. If the tutorial tells you to move from cell A1 to C2 by pressing the right-arrow key twice and the down-arrow key once, that's what you do. Don't even try using the F5 (GOTO) key unless the program says to use that instead of the cursor keys.

I often found that in the middle of a complex procedure, such as setting up a Data Table, I wanted to take a little cruise around the spreadsheet and look at the formulas in certain cells. None of these tutorials allow free movement within the spreadsheet.

1-2-3 TRAINING

Tutor demonstrates how the help screens work, for instance, but the F1 key is only active during this demonstration. In fact, the 1-2-3 help file on the tutorial disk contains only those screens used during this brief demonstration.

The *DoMore* program is particularly annoying when it comes to ranges. Although 1-2-3 requires only one period to separate the two cells of a range definition, the *DoMore* quizzes request two periods before they will accept your answer.

ASI's *Productive Application of Lotus 1-2-3* advances slightly beyond the usual keyboard restrictions. At some points in the tutorial, the instructions say to use either the pointing method or the typing method for specifying a range. But this apparent freedom is illusory. The program simply accepts two alternate series of keystrokes, and any deviation from what the program expects for these two alternates produces a beep and an error message.

JUST BROWSING

When you learn from a manual, you can skip around from topic to topic with relative ease. You just stick something (a finger will do) in the pages, flip to the index or table of contents, read another few pages, and then come back. Disk training programs are usually not so amenable. One exception to the general rule is *DoMore with Lotus 1-2-3*. It has 20 "chapters" in the training program, and at any time, you can leave a chapter, go to the index, and begin another chapter. Chapters always begin at the beginning, but function keys allow paging back and forth through the chapters.

The *DoMore* program is somewhat tree-structured. At various points, you can either receive a detailed treatment of a topic or skip to the next topic. The program sometimes uses a function key to display more information about particular items. If you already know what ASCII means, for instance, you don't have to read an explanation of it.

The *DoMore* program also includes a nice personalized bookmark that records the screen where you exit the training program so the next time you can pick up where you left off, even in the middle of a chapter. The system also records bookmarks for more than one program user.

At the other extreme is the *Tutor* program. You may page back and forth through the screens of each lesson with the PgUp and PgDn keys, but the paging back movement is abominable and gets worse as you go further into each lesson. For instance, it takes 1 full minute to page back from the last screen of lesson D to the previous screen. This may be an extreme example because lesson D includes some Data Table calculations, but it is still astonishing.

Why this long delay? The actual 1-2-3 worksheet is being modified in the course of each lesson, and paging back to a previ-

The *DoMore* program is somewhat tree-structured. At various points, you can either receive a detailed treatment of a topic or skip to the next one.

ous screen requires the worksheet to be entirely reconstructed from the beginning of the lesson. This is inherent in the structure of the Lotus tutorial, and after studying the Lotus TUT files and how they worked, I don't see any way around this problem. An actual worksheet is being modified during the screens and the only way to "unmodify" it (aside from saving all versions of it along the way) is to start over again from the beginning.

In choosing a disk-based tutorial, one of your primary considerations should be its appropriateness for your level of experience. The order in which topics are introduced is particularly important: a program that throws complex procedures at you before explaining the basics will lose beginners immediately. None of these programs cover the entire breadth of 1-2-3. If you're looking for depth, only one source is available—the 1-2-3 User's Manual. Although

some of these disk trainers attempt to cover a lot of different topics, they are again deficient in the depth they can explore.

Cdex's *Teach Yourself Lotus 1-2-3* is probably the best program for absolute beginners. It explains the early material in a meaningful order, slowing down when it has to for breathers and fuller discussion. It is, however, the slowest program of the lot, and it covers the least material because it is geared toward beginners. However, it covers this introductory material very well. After you complete the disk, you'll be able to enter labels, numbers, and formulas, print and save worksheets, and do some formatting and prettifying, but that's about it.

The Cdex *Advanced Training for the Lotus 1-2-3 Program* is not a simple continuation of the *Teach Yourself* program. *Teach Yourself* was programmed by Deltak Microsystems, and *Advanced Training* comes straight from Cdex. The latter program is slicker and more professional looking but lacks the breezy informality of the former. The material, including treatment of keyboard macros, in *Advanced Training* is quite astonishing; it even covers the programming-like macros for using GOTOs and subroutine calls, printing messages, and creating user menus.

WHAT-IF ANALYSIS

The *Tutor* program also takes a good approach to covering the material. The first command to be introduced is /File Save at the end of the first of six lessons. The *Tutor* introduces no topic before its time and shows each new topic as a solution to a problem. Does a label begin with a number? Label prefixes are introduced. Did you misspell a label? Fix it with the F2 (Edit) key. Do you want to save typing time? Try the Copy command. Does Copy not work correctly sometimes? You need an absolute reference. Will a 20-year sum be a long formula? Try the @SUM function. You can't see the whole worksheet on the screen? Split it and freeze the titles. Are you getting tired trying too many "what ifs"? Time for a data table.

ATI's *Teach Yourself Lotus 1-2-3* takes an approach that is genuinely crazy. Before you even enter any labels or text in its make-believe spreadsheet, it requires you to change the width of column A. After a

BORLAND INTERNATIONAL SAYS 'MERCI,' 'TAK SA MYCKET,' 'GRAZIE,' 'TERIMA KASIH,' 'GRACIAS,' 'ARRIGATO,' AND 'THANKS A LOT.'

"Thanks a lot," in every language, for your trust, your business and your patience. We're later than we said we would be, in starting to ship 'SuperKey'™ — which we started shipping Monday, May 20, 1985. And we think we have good reasons for our slight delay.

Reasons, not alibis.

Very simply, we came up with ideas that improved the original about-to-be released 'SuperKey' package. Ideas like "DES" (the U.S. Government's "Data Encryption Standard") — which is now on 'SuperKey.' It lets you keep confidential files, confidential; private letters, private. It scrambles your words — to everyone but you. Your secret Password — at your command — brings your files back to life — just as they were before encryption.

EXPORT BAN. SORRY.

The power and security offered by 'SuperKey' also puts us in an awkward spot — because while we're thanking everyone, we must at the same time apologize to our international customers, because the American Government has banned all export of 'SuperKey.' It is, however, now freely available in the U.S.

All the additional features now on 'SuperKey,' have been added without increasing the price — which is only \$69.95.

LEADING-EDGE TECHNOLOGY.

ROCK BOTTOM PRICES.

You're probably aware by now, that at Borland, we're not trying to become rich beyond the dreams of avarice — overnight.

Our prices for all our programs, are hundreds less than the would-be competition. And when you buy Borland, you buy more than superb quality.

You buy speed, power and price.

REASONABLE LICENSING AGREEMENTS AND NOT COPY-PROTECTED SOFTWARE.

When you buy Borland, you're given this simple licensing agreement.

This software is protected by both United States Copyright Law and International Treaty provisions. Therefore you must treat this software just like a book with the following single exception. Borland International authorizes you to make archival copies of the software for the sole purpose of backing up your software and protecting your investment from loss.

It won't need a trip to the Supreme Court for interpretation — or trying to tell you what you're allowed to do with the product you just paid for. And best of all we always offer not copy-protected versions of our software.

You're given an affordable chance to take the programming leap to Turbo Pascal™; to put 'SideKick'™ to work for you — and now you can even use 'SideKick' and 'SuperKey' in combination. (Using them in tandem is what the first moon-men called a 'giant step for Mankind').

Again,
Thank You,

PKah

1-2-3 TRAINING

few titles are entered, it discusses locking the titles, but this point comes even before scrolling is explained. After employee data is entered, the employees are sorted (we're still early in the training here), and the all-important concept of a 1-2-3 range is glossed right over. Although the ATI program cannot simulate scrolling the worksheet, it discusses synchronized and unsynchronized windows. Often the program carries you through a whole wealth of instructions with only a dim explanation of its goal.

The ATI package continues with an extensive demonstration of creating a data table. However, its data table example obscures the whole point of what a data table is supposed to do. In fact, the calculation it illustrates does not need a data table at all.

ASI's *Productive Application of Lotus 1-2-3* covers most of the basic material; however, it dies of exhaustion soon after printing and saving files. It attempts to cover what-if analysis but does so only by replacing values on the spreadsheet. It doesn't touch /Data functions but takes a crack at macros—unfortunately, it's a very sketchy and incomplete explanation. The tutorial starts out fine with worksheet navigation but then introduces the command hierarchy and 1-2-3 error messages in the second lesson—a progression that spread-

sheet neophytes are sure to find confusing. It eventually straightens itself out and begins covering material in a reasonable manner, but I'm afraid that may be too late for some.

ASI's *Productive Application of Lotus 1-2-3* covers most of the basic material; however, it dies of exhaustion soon after printing and saving files.

DoMore with Lotus 1-2-3 suffers from its inability to imitate 1-2-3 and has to interrupt a generally good order of topics to explain why things are different in this program than in the real 1-2-3 spreadsheet. Although it is nicely laid out and makes good use of color, it is essentially a screen-flipper with occasional questions and quiz-

zes. It provides various exercises for you to try out with the real 1-2-3 program and tells you to print the screen to get a copy. But these screens contain a lot of graphics characters that will not print on all printers and some of which will not even print on the IBM Graphics Printer.

The *DoMore* program covers more functions than any of the others, even including @IF, @LOOKUP, and @CHOOSE, but it goes so quickly that much of it is incomprehensible. It doesn't touch /Data and /Graph commands but has one screen on keyboard macros that is essentially a "this stuff is possible also" display.

Except for a brief demonstration in the *Tutor*, none of the programs have any substantial information on the single most important key in 1-2-3—the F1 (help) key. The help screens in 1-2-3 are truly one of the most incredible features of this program; the fact that even long-time users of 1-2-3 don't automatically go for help when perplexed about something indicates that the F1 key has not been given the emphasis it deserves.

None of these programs actually print anything on a printer, although they all go through the motions. Surprisingly, all of the tutorials, except for *DoMore*, cover graphics, but only the ATI program works

Borland's SuperKey™ lets one powerful keystroke do the work of hundreds and helps keep your confidential files ... confidential!

SUPERKEY TURNS 1,000 INTO 1! Yes, SuperKey can record lengthy keystroke sequences and play them back at the touch of a single key. Instantly. Like Magic. Say, for example, you want to add a column of figures in 1-2-3. Without SuperKey you'd have to type seven keystrokes just to get started. ["shift-@-s-u-m-shift-(")]. With SuperKey you can turn those 7 keystrokes into 1.

SUPERKEY HELPS PROTECT YOUR CAPITAL INVESTMENT. SuperKey, at your convenience, will make your screen go blank after a predetermined time of screen/keyboard inactivity. You've paid hard-earned money for your PC. SuperKey will protect your monitor's precious phosphor ... and your investment. This feature alone justifies your SuperKey purchase!

SUPERKEY KEEPS YOUR 'CONFIDENTIAL' FILES ... CONFIDENTIAL! Time after time you've experienced it: anyone can walk up to your PC, and read your confidential files (tax returns, business plans, customer lists, personal letters ...). With SuperKey you can encrypt any file, even while running another program. As long as you keep the password secret, only YOU can decode your file. SuperKey implements the U.S. government Data Encryption Standard (DES).

SUPERKEY PROTECTS YOUR WORK FROM INTRUDERS WHILE YOU TAKE A BREAK.

Now you can lock your keyboard at any time. Prevent anyone from changing hours of work. Type in your secret password and everything comes back to life ... just as you left it.

THE CRITICS' CHOICE

"While most people only talk about low-cost personal computer software, Borland has been doing something about it. And Borland provides good technical support as part of the price."
John Marshall & Paul Frutkiner, *ComputerWeek*

"What I think the computer industry is headed for: well-documented, standard, plenty of good features, and a reasonable price."
Jerry Purnell, *BYTE*

1-2-3 TRAINING

with the standard IBM adapter and monochrome display because it mimics graphs using block characters instead of dots. However, the ATI program doesn't warn you that normal 1-2-3 graphics don't show up on the monochrome display.

YES, BUT CAN IT TEACH?

Of the six 1-2-3 tutorials, only the *Tutor* comes with a substantial manual. The other five manuals are small reference guides for using 1-2-3 rather than supplements to the tutorial. The skimpiness of these manuals indicates that the companies seriously treat their disk tutorials as nearly stand-alone systems. Do they really expect users to get along with just these tutorials and completely ignore the 1-2-3 manual? No chance.

None of these on-line tutorials really sparkle by themselves as the solution. You'll probably have to use more than one if you would like to learn 1-2-3 entirely from disks—perhaps, starting off with the *Cdex Teach Yourself* course and then moving on to the *Tutor*.

Overall, the best single disk tutorial is *Tutor*. I know that \$495 may seem steep for an on-line tutorial, but you get a terrific spreadsheet program called 1-2-3 along with it. The manual isn't bad either.

—Charles Petzold

VCR TRAINING TACTICS

Several months ago you purchased 1-2-3, and you've been wrestling with it ever since. You don't have time to attend a seminar, you're uncomfortable with the restrictions of disk-based tutorials, and you're tired of reading books. Why not switch on your VCR, sit back in your chair, and watch a PC video on 1-2-3?

Audio cassettes and videotape training for personal computer users may be the brightest stars on the training horizon. Reviewed here are two audio cassettes (from FlipTrack Learning Systems and Total Learning Systems) and three videotapes (by Anderson Soft-Teach, Arthur Young

Business Systems, and Learn-PC Video), designed to teach 1-2-3.

All the tapes are designed to be used while you have 1-2-3 running on your PC. Interested in a particular feature half way through the tape and want to explore it further? Just stop the tape, save your file so you can pick up where you left off, and try anything you like. Incidentally, this freedom also permits you to make errors more

exercises, advanced instruction, or quizzes on the subject you have just completed. For example, at the end of a lesson on building formulas, the FlipTrack side offers such topics as exponentiation and use of parentheses to control order of precedence.

If you elect to turn to the FlipTrack side, you are instructed to set your tape player's counter to zero before listening to

Using an audio tape is similar to getting hands-on instruction from a teacher who is standing behind you and is issuing instructions while you key in your data. However, because you don't really have someone watching over you, you must be careful to follow each keystroke given by the tape's announcer.

easily than does the closely controlled environment of computer-based training—nothing confirms the correctness of your keystrokes. But, then, you can always use the rewind button.

AUDIO CASSETTES

Using an audio tape is similar to getting hands-on instruction from a teacher who is standing behind you and is issuing instructions while you key in your data and watch your monitor. However, because you don't really have someone watching over you, you must be careful to follow each keystroke given by the tape's announcer. For example, one missed instruction to press the PgDn key prior to an instruction to enter a formula on the worksheet can put a formula in cell A20 that actually should be in cell A40.

FlipTrack Learning Systems offers a stunning 8 hours of tapes, entitled *How to Use Lotus 1-2-3*, that explain more features of 1-2-3 (and in more detail) than any of the other audio cassettes or videotapes that are reviewed here. FlipTrack takes its company name from a unique feature: at key junctures in the course, the announcer offers you the option to turn to the "FlipTrack" side of the tape for reinforcing ex-

ercises, advanced instruction, or quizzes on the subject you have just completed. When the FlipTrack lesson terminates, you rewind the tape until the counter reaches zero, turn it back to the original side, and pick up where you left off with the regular program. FlipTrack says this patented branching feature is exclusive to its products.

Total Learning Systems's *TLN Tutor* for 1-2-3, a 90-minute tape, doesn't attempt to be nearly as comprehensive as FlipTrack's audio cassette or the longer videos. The tape begins with a good introduction and then helps you install the 1-2-3 disk into your computer and format a data disk. After an admirable start, however, *TLN Tutor* runs away.

Although the tape is brief, it lacks a central example to introduce the skills being taught. Unfortunately, when the tape does develop an example, such as a tax-planning model, it implements it poorly. The announcer instructs you to type the model's formulas on the worksheet prior to giving you the data to which these formulas will refer, robbing you of any understanding of your work as you perform it. Furthermore, the example employs an advanced 1-2-3 formula (nested @VLOOKUP functions) that will probably set a novice's head spinning.

Borland's SideKick™ Will Clear Your Desk In 30 Minutes And Increase Your Productivity By 50%

SideKick is a combination of seven desktop accessories, which makes SideKick the single most effective business tool. Just a keystroke suspends your application program, giving you a window into SideKick. Another keystroke brings you back to where you were. Instantly. It's that easy.

A FULL-SCREEN WORDSTAR™-LIKE EDITOR

You may jot down notes and edit files up to 25 pages long.

AN ASCII TABLE for easy reference.

AN AUTO-DIALER for all your phone calls. It will look up and dial telephone numbers for you. (A modem is required to use this function.)

GETTING THE BUGS OUT

Because most people use audio tapes in the self-study mode that offers no video feedback to confirm the correctness of their worksheet operations, it's especially important that audio tapes be error free. For instance, page 8 of FlipTrack's *How to Use Lotus 1-2-3 Lesson Summary* handbook instructs you to see section on "Preparing Lotus for Use" in the 1-2-3 user's guide—such a section doesn't exist in my 1-2-3 manual (Version 1A). Although the 1-2-3 manual does have a section describing how to handle the operation in question, it is listed under a different section title than the one in the FlipTrack reference. In all fairness, however, that was one of only a few problems I found in this otherwise excellent program.

TLS Tutor suffers from several instances of omitted keystroke instructions—notably in the printing lesson. In the first such instance, you are instructed to select Go to print a worksheet, and 1-2-3 responds by beeping instead of printing. Why? The tape neglects to tell you to specify a range (area on the worksheet) to print—a 1-2-3 requirement. In the next exercise, the instructor does tell you to select the Range command but fails to mention the need to anchor the pointer (used to specify the beginning of a range) prior to specifying that range.

HELP FROM MANUALS

What if you forget something you learned on the tape and didn't make a note of it? FlipTrack provides a 63-page lesson summary to accompany its tape. You cannot use this booklet to reproduce the exercises created with the tape because it lacks the formulas you need to build the models. However, it does contain a four-and-a-half-page index so that you can use it to look up any commands you may have forgotten.

Just to experiment, I checked the @SUM and the Data Table commands. The information on @SUM was sufficient to allow you to relearn it without having to use the tape again. However, the same check on the Data Table commands yields the opposite result—inadequate explanation in the manual will force you to relocate the segment on data tables on the tape in order to refresh your memory.

TLS Tutor provides no written reference. Instead, the tape suggests you use the 1-2-3 reference manual. This is not a bad suggestion because the 1-2-3 manual has a great deal of useful information, but it should not be left there. Two features that no audio or videotape I reviewed provide are an introduction to the manual (particularly the special indexes and appendixes) or any cross references between their

The visual orientation of videotape makes the style employed in each presentation a much stronger factor here than it would be in any other medium.

own documentation and the 1-2-3 manual. In fact, only FlipTrack bothered to demonstrate the usefulness of the 1-2-3 encyclopedia on-line help system.

SEEING IS BELIEVING

According to Charlotte Hofmann, a consultant who has used videotapes from Anderson Soft-Teach to train personnel in both the United States and France, videotapes succeed for the same reason 1-2-3 itself does: they are highly visual.

All three videotapes I reviewed provide clear, high-quality instruction and will be valuable tools for either novices learning 1-2-3 or moderately experienced users exploring new functions. The differences among them involve instructional style, depth of 1-2-3 coverage, use of other materials (such as manuals and disks), and price. All the tapes are available in VHS, Beta, and Umatic (3/4-inch) formats.

THE ELEMENTS OF STYLE

The visual orientation of videotape makes the style employed in each presentation a much stronger factor here than in

any other medium. For example, the Anderson Soft-Teach tapes adopt a conversational approach. As the viewer, you experience the course somewhat vicariously—looking on while a consultant teaches the sales manager of an office products company about 1-2-3. The manager plays devil's advocate and expresses the concerns of a novice. Moreover, it's educational as well as reassuring to watch another person asking questions and learning the same program as you are.

The two Soft-Teach tapes are relatively short (about 37 minutes each) and give a brief overview of 1-2-3. They lightly cover each major area of the program, including macros. For example, the instruction on data management focuses on the Data Sort commands. It only mentions the powerful Data Query commands (used to locate information in a 1-2-3 database and create reports with it); no instruction is provided. To their credit, the tape's designers were very explicit about this type of format and encourage you to use the information you have learned as a starting point to explore the other functions of 1-2-3.

Arthur Young's Lotus 1-2-3 Self-teaching Video Course (from the Big Eight accounting firm, Arthur Young Business Systems) evokes a classical mood that's well suited to its corporate roots: an English-accented moderator speaks in a measured, even-toned voice delivering lessons terminated by flourishes of music reminiscent of "Masterpiece Theater." And the tape succeeds because there's substance beneath the style.

At just over 3 hours, it is the longest, most in-depth videotape, though it's not the most expensive. It comes with a comprehensive manual and a disk containing preconfigured worksheet files for exercises. The extra length of the tape allows it to go beyond command skills and include a valuable segment on proper controls for spreadsheet applications, such as preliminary assessment, planning, structuring, testing, archiving, and documenting an application.

Sitting down to learn a new program can bring out latent narcolepsy even in the most dedicated students, but the up-tempo pace and "60-Minutes"-like punch of *Learn-PC Video's Introduction to Lotus 1-2-3* will keep you wide awake. Its instruc-

Borland Introduces the Laws of *TURBO DYNAMICS*™

Laws That Work Like Magic. Whether considering technological excellence, or innovation in areas such as pricing, not copy-protection, licensing agreements, site licenses, 60 day money-back guarantee —Borland is clearly recognized as the software industry leader. The following three laws of "Turbo Dynamics"™ exemplify our pledge for excellence.

2ND LAW:

NOT COPY-PROTECTED SOFTWARE AND REASONABLE LICENSING AGREEMENTS.

We will always offer not copy-protected versions of our software. Also, our licensing agreement is now so simple that even a child can understand it.

1ST LAW:

SPEED, POWER AND PRICE.

Borland products are known to be fast, powerful and to deliver an incredible price performance ratio. We only believe in absolutely superb software at rock bottom prices.

3RD LAW:

60 DAY MONEY-BACK GUARANTEE.

This third law is actually a first in the industry! We are so sure that you will love our software that all of our products now come backed with a 60 day money-back guarantee. No questions asked.

Turbo Dynamics Applies to Turbo Pascal.

Borland's Pascal family of products is growing by leaps and bounds.

You can now join hundreds of thousands of users and enter the world of Turbo Pascal programming. And remember, all three laws of Turbo Dynamics

apply to all Borland products.

TURBO PASCAL™ \$69.95

The industry standard. With more than \$50,000 users worldwide Turbo Pascal is the industry's de facto standard. Turbo Pascal is praised by more engineers, hobbyists, students and professional programmers than any other development environment in the history of microcomputing. And yet, Turbo Pascal is simple and fun to use.

spreadsheet included on every Turbo disk with ready-to-compile source code. **Options:** We offer the exciting Binary Code Decimal (BCD) option for your business applications as well as an 8087 option for your number-crunching applications at a very low charge. Please refer to the coupon **Portability:** Turbo Pascal is available today for most computers naming: PC-DOS, MS-DOS, CP/M-80 or CP/M-86. **Jeff Overmire, PC Magazine:** "In its simplicity it achieves an elegance that no other language compiler has ever displayed."

TURBO GRAPHIX TOOLBOX™ \$54.95

High resolution monochrome graphics for the IBM PC.

The Turbo Graphics Toolbox will give even a beginning programmer the expert's edge. It's a complete library of Pascal procedures and functions. Tools that will allow you to draw and hatch pie charts, bar charts, circles, rectangles and a full range of geometric figures. Procedures that will save and restore graphic images to and from disk. And much, much, more. You may incorporate part or all of these tools in your programs and yet we won't charge you any royalties. Best of all, these functions and procedures come complete with commented source code on disk ready to compile.

TURBO TUTOR™ \$34.95

From start to finish in 300 pages, Turbo Tutor is for everyone from novice to expert. Even if you've never programmed before Turbo Tutor will get you started right away. **A must.** You'll find the source code for all the examples in the book on the accompanying disk ready to compile. Turbo Tutor might be the only reference on Pascal and programming you'll ever need.

TURBO DATABASE TOOLBOX™ \$54.95

The Turbo Database Toolbox is the perfect complement to Turbo Pascal. It contains a complete library of Pascal procedures that allows you to sort and search your data and build powerful applications. It's another Borland set of tools that will give the beginning programmer the expert's edge. **Get started right away, true database!**

Included on every Toolbox disk is the source code to a working data base which demonstrates how powerful and easy to use our search system, Turbo-Access, really is. Modify it to suit your individual needs or just compile it and run. **Remember, no royalties!**

In just the last few months, The NETWORK has saved its members more than \$24,000,000 and processed over 100,000 orders.

Listed below are just a few of the over 20,000 products available at our EVERYDAY LOW PRICES! All software below is priced in IBM-PC format.

The nation's largest corporations depend on PC NETWORK!

On our corporate roster are some of the nation's largest financial industrial and professional concerns including some of the most important names in the computer industry:

AT&T	General Motors
Barclays Bank	Gillette
Bell & Howell	Hewlett Packard
Citibank	Hughes Aircraft
Columbia University	IBM
Data General	ITT
Exxon	Kodak
Farm Bureau Insurance	Multimate
Frontier Airlines	United Nations
General Mills	Yale University
General Electric	Vetlesen's Administration

plus thousands of satisfied consulting firms, small businesses, user groups, municipalities, government agencies and value-wise individuals **ACROSS THE NATION!** Their buyers know that purchasing or renting from PC NETWORK saves them time, money and trouble. They also count on us for product evaluation, professional consultation and the broadest spectrum of products and brands around.

PRICING MADNESS

Once again, as Federal Express picks up our ad at the very last millisecond before this issue's advertising deadline, here we sit with dozens of price reductions and new product announcements which have arrived too late for us to let you know.

Why, our ad manager asks, do we always go through a last minute price update frenzy, just seconds before our ad is due at the publisher, when we know that despite our heroic effort, *many of these products will cost even less by the time you read this ad.*

How, she asks, can we get a crystal ball to forecast what fantastic promotions and specials our suppliers are going to offer from now to the date *this ad gets to the newsstand over two months from today?*

Well, we decided that she has a good point. While we'll still keep getting our grey hairs and ulcers from last minute revisions, we will start publishing this notice and ask our readers to make a simple check. Look at any four back issues of this magazine (*yes we're in every one*) and track the prices on the most popular products. *You will see that many drop with every issue.* Most of these price changes were instituted well before the issue was printed and *our members always pay the lower price.* This should prove that this notice is much more than hype.

Given the current madness in the PC industry with its spur of the moment pricing and instant product introductions, ***you will find it always pays to call for our latest prices.*** You will be glad you did.

THE NETWORK

... WITH THESE 15 UNIQUE BENEFITS

1 COST + 8% PRICING—The NETWORK purchases millions of dollars in merchandise each month. You benefit in receiving the lowest price available and all at just 8% above published dealer wholesale price.

2 OUR 600 PAGE WHOLESALE CATALOG—Members receive our 600 page wholesale catalog containing over 20,000 hardware and software products for the IBM PC, APPLE and over 50 other popular computer systems. The NETWORK'S CATALOG IS THE LARGEST COMPILED OF PERSONAL COMPUTER PRODUCTS AVAILABLE TODAY. NOW UPDATED QUARTERLY!

3 IN-STOCK INSURED FAST HOME DELIVERY—The NETWORK maintains a giant multi-million dollar inventory of most popular products, allowing us to ship many orders from stock. Non-stock items are typically maintained in local warehouse just days away from The NETWORK and YOU. We pay all insurance expenses on your shipment. EMERGENCY OVER-NIGHT SERVICE IS AVAILABLE ON REQUEST.

4 10 DAY RETURN POLICY—If you are not satisfied, for any reason with any hardware component purchased from The NETWORK within 10 days of receipt, we will refund your entire purchase (less shipping) with no questions asked.

5 MEMBERSHIP SATISFACTION GUARANTEE—If for any reason you are not satisfied with your membership within 30 days, we will refund your dues IN FULL.

6 EXPERIENCED CONSULTANTS—The NETWORK hires consultants, not order takers, to aid you in product selection. Our consulting staff possesses in excess of 150 man years of personal computer product experience. We back our consultants with our money back guarantee: IF ANY PRODUCT RECOMMENDED BY OUR CONSULTING STAFF FAILS TO PERFORM AS PROMISED—WE WILL TAKE IT BACK AT OUR EXPENSE FOR A 100% REFUND.

7 FREE TECHNICAL SUPPORT—The NETWORK supports every product it sells. Our qualified TECH-SUPPORT staff will help you assemble your system, interpret vendor documentation and get your software and hardware to work. WE WILL GIVE YOU ALL THE HELP YOU NEED, WHEN YOU NEED IT—FREE!

8 OPTIONAL BUSINESS RENTAL LIBRARY—All members can join our BUSINESS RENTAL LIBRARY featuring over 1000 available titles for just \$25 PER YEAR above the base membership fee. This entitles you to rent business software AT JUST 20% OF THE DISCOUNT PRICE FOR A 14 DAY PERIOD. If you decide to keep the software, the entire rental fee is deducted from the purchase price. VISA/MC/AMEX/Discover ALL 30 DAYS for just \$30 above the V.I.P. base fee. This also includes the game library privileges for a \$5 combination savings.

9 OPTIONAL GAME SOFTWARE RENTAL LIBRARY—The Game Rental library is available to members for just \$10 PER YEAR and permits evaluation (or just enjoyment) of any game or educational software product as above.

10 SPECIAL SAVINGS BULLETINS—THE PRINTOUT—Issued Quarterly at no charge to Network members only! The Printout contains all the New Product listings and price changes you need to keep your Catalog up to date. Also, we buy excess dealer inventories, and store bulky computer goods, which we turn around and make available to our members at fantastic savings via THE PRINTOUT.

11 DISCOUNT BOOK LIBRARY—Working with numerous publishers and distributors, The NETWORK has assembled a library of over 1000 computer related books and manuals at savings of up to 75% from the normal store price.

12 MEMBERSHIP REFERRAL BONUS—Our most valuable source of new members is YOU! To date almost 40% of our members have been referred by word of mouth from other satisfied members. For those of you who refer new members, The NETWORK will credit a cash bonus to your account applicable to any future purchase.

13 CORPORATE ACCOUNT PROGRAM—Almost 50% of The NETWORK's members are corporate buyers and users (see opposite page left). The NETWORK can establish open account status and assign designated account managers to expedite orders, and coordinate multiple location shipments.

14 QUANTITY DISCOUNTS—For large corporations, clubs, and repeat or quantity buyers The NETWORK can extend additional single order discounts, when available to us from our manufacturers and distributors.

15 PRICE PROTECTION—The PC industry is crazy! Prices change not yearly or monthly or even weekly but often day by day! These changes are sometimes up but are mostly down! The NETWORK GUARANTEES THAT IN THE EVENT OF A PRODUCT PRICE REDUCTION, BETWEEN THE TIME YOU PLACE YOUR ORDER AND THE TIME THE PRODUCT SHIPS YOU WILL ONLY PAY THE LOWER AMOUNT!!

1-2-3 TRAINING

tor possesses the purposeful, polished presence of a network news anchor. The tape punctuates explanations of 1-2-3 operations and on-screen instruction with full-screen graphics to emphasize and summarize key points. It runs for just under 2½ hours and includes a reference manual and a disk of preconfigured worksheets.

DIRTY LAUNDRY

Lest you think that these tapes are the wonderkind of PC education, you should know about some of their bloopers. Two packages, *TLS Tutor* and *Learn-PC Video*, adopt terms that are not included in the 1-2-3 manual, in effect creating their own names for 1-2-3 operations. *Learn-PC Video* calls the "period" key the "until" key when it's used to establish the corner of a range (1-2-3 terms this operation "anchoring the pointer"). This term is useful as long as you operate within the context of the training program, but when you consult the 1-2-3 manual for more information on the "until" key, you won't find any.

Anderson Soft-Teach is one of only two programs here to introduce 1-2-3's powerful File Combine commands that are used to consolidate worksheets. However, amid its enthusiasm for the benefits of this operation, the tape gives no warning of its cor-

responding liabilities. When the program executes File Combine commands, the position of 1-2-3's cell pointer determines the position of the incoming data on the worksheet. With the cell pointer incorrect-

TLS Tutor and Learn-PC Video adopt terms that are not included in the 1-2-3 manual; in effect the programs create their own names for 1-2-3 operations.

ly positioned, this operation can turn your worksheet into alphabet soup.

Despite their overall effectiveness, both the *Learn-PC* and *Arthur Young* tapes fell victim to a similar technical error. In the segment on Data Query commands, these tapes instruct you to specify an **Output Range** (to receive reports from your 1-2-3

database) in a manner that could easily result in lost data.

1-2-3 allows you to specify output ranges, including just the field names of each database field in your report, or include the number of rows beneath those field names to which you wish to restrict the output range. Both tapes mention only the former approach but fail to point out that 1-2-3 will automatically erase the entire column beneath each field name prior to creating your report. If there are any other entries between those field names and the bottom row of the worksheet, 1-2-3 will also erase them without warning (the latter method of restricting the output range to certain rows avoids this problem). While the *Arthur Young* manual mentions the problem, it deserves much more prominent attention.

THE RIGHT TOOL?

Despite occasional lapses in instructional integrity, all three videotapes are very effective tools if, of course, they are used appropriately. The secret to success with both audio and videotape training lies in understanding precisely what they will and won't do for you.

None of the 1-2-3 tapes are meant to deal with the challenges of DOS. Nor do they address the wide variations in hard-

ware that affect the way you use 1-2-3 (there are several places where XT users will find themselves confused by instructions pertaining only to users of dual-floppy systems) or cover the entire range of available commands (no one covered the commands that enable you to maintain a library of graph settings within your worksheet).

For these reasons, trainers point out that it's important to properly prepare students before turning them over to a videotape or audio cassette, and a number of companies use videotapes in conjunction with a live trainer to meld the advantages of both methods. Used independently of a trainer, you should regard a tape as a starting point from which to expand your skills.

—Richard W. Riddington, Jr.

Richard W. Riddington, Jr., is a freelance writer and consultant for Soft Industries in Southington, Connecticut.

FORMAL TRAINING

Most people have an instinctive reaction when faced with the prospect of learning a new skill: to go take a course. It's an understandable response. After all, didn't you spend 12 to 16 of your formative years sitting in classrooms?

The large number of different seminars available for 1-2-3 becomes even more impressive when you realize that nearly two-thirds of these are regional offerings, as opposed to nationally marketed programs. Considering how frequently these courses are offered, it appears that many 1-2-3 users are responding to the instinctive call of the classroom.

WHERE THE COURSES ARE

Most nationally marketed seminars are 1 or 2 day programs sponsored by a non-profit educational organization or the continuing education division of a university. You can find similar offerings at many local colleges and universities. These local offerings can take the form of either a traditional semester course or a shorter, more-intense program. Many community colleges respond to the needs of working students by offering their courses during evening and weekend sessions.

Private-sector opportunities abound also. Many computer stores are discovering that customers need training on many programs and have made an effort to meet these needs by holding frequent training sessions for the more popular programs. In addition, centers that specialize in computer training—often their only service—offer courses at their own facility or will send instructors to your company for a private training session.

Different levels of 1-2-3 training are available, even from a single source. Novice courses are generally designed for people who have never used 1-2-3 or even a computer, for that matter. Intermediate-level courses usually assume that you know how to operate a computer and have at least experimented with the 1-2-3 tutorial. Advanced courses require that you be familiar with the basic 1-2-3 operations and be capable of creating worksheets and manipulating data; these courses cover such topics as macros, data functions, and advanced functions.

A new development in the seminar marketplace is the creation of "vertical

"Lotus 1-2-3 for Sales and Marketing Professionals" taught at Boston University Metropolitan College; and a two-day lecture/demonstration on 1-2-3 and *Symphony* offered by the Software Institute of America in Andover, Massachusetts.

This group includes at least one course from each level of difficulty and from each kind of sponsoring agency (national and regional university/nonprofit, computer store, and private center). The first three offer hands-on instruction, but the fourth does not. The courses cover a wide spectrum of approaches and skill levels. They range from 4 hours to 2 days in length and cost from \$195 to \$347.50 per day. Some courses give participants a disk filled with valuable templates to take home, while others offer only a collection of handouts as a reference.

Perhaps the most striking difference is in the objectives of these sample courses. The Productivity Center and Computer Town courses teach participants skills that they can put to immediate use. For example, the Productivity Center course description leads off with detailed objectives:

The Productivity Center and Computer Town Courses teach participants skills that they can put to immediate use. On the other hand, the Boston University Metropolitan College and Software Institute seminars instead focus on exposing participants to the power and potential applications of 1-2-3.

market" training sessions that focus on a specific population and target all a workshop examples to their needs. This can be a way to get a customized training session without paying for a custom program.

To examine the potential effects of these various factors, I chose four programs: the half-day "Introduction to Lotus 1-2-3" from Computer Town, a computer store in Salem, New Hampshire; "Advanced Lotus 1-2-3" at the Productivity Center of the Center for Advanced Data Processing in New York City; the two-day

"Upon completion of the workshop, participants will be able to design and implement complex financial and operational models using the advanced spreadsheet capabilities of Lotus." Jim Moriarty of Computer Town points out that the Lotus tutorial will not let you make mistakes, but his course lets you experience the consequences of making errors and then he shows you how to correct them.

The Boston University and Software Institute seminars do not aim to provide competency but instead focus on exposing

INTRODUCING 5

**WE INTERRUPT
PRODUCT
BRING**

THIS MAJOR INTRODUCTION TO YOU SOMETHING REALLY IMPORTANT.

THE BIG NEWS IN DISK/TAPE IS PC/T, A SENSIBLE NEW APPROACH TO ARCHIVAL STORAGE.

We've tamed tape. And made it docile. By making it DOS-like.

So, while this started as an ad for our five new HardFile™ subsystems, which deliver 25 to 80 megabytes of hard disk storage and 60 megabytes of tape backup, instead we want to introduce you to PC/T™

PC/T is a new format that makes tape a more sensible storage solution for personal computers. It puts tape on line, in real time, for instant access. And frees your hard disk for your most current data.

You already know how to use PC/T. Because it responds to standard DOS commands.

Here's the big news: just like any DOS-controlled hard or floppy disk, PC/T enables you to create directories and files on tape. Then you can call up the exact file you need, and change a portion of the tape without having to erase and overwrite the entire cartridge.

Without PC/T, you have to rewrite the entire 60 MB cartridge each time you make a single change.

With PC/T, you create and directly access files on tape, just like with floppy or hard disk.

PC/T formats each new tape cartridge, just like you format any hard or floppy disk, locking out bad blocks to assure that every bit of data you write to tape is recorded with utter accuracy.

What's more, PC/T gives tape true error correction capability. 50% redundancy during write operations ensures 100% reconstruction of data lost because of operator error, dust and dirt, or everyday wear and tear.

There is a catch. You can get your hands on PC/T just one way: Buy one of our powerful new HardFile subsystems. With disk plus tape. Or tape alone. Which brings us back to where we started. And gives you a place to start. Just call 1-800-228-DISK for the Tallgrass dealer nearest you.

**TALLGRASS SELLS MORE HARD DISK
STORAGE WITH CARTRIDGE TAPE
BACKUP THAN ANYONE IN THE
WORLD.**

1-2-3 TRAINING

the participants to the power and potential applications of 1-2-3. Bill Luther, who conducts the vertical course "Lotus 1-2-3 for Sales and Marketing Professionals" at the Boston University Metropolitan College, actually uses Lotus's *Tutor* in the early part of his session, but he spends most of the time working with a series of complex marketing templates that show how 1-2-3 can't be read for market analysis. "The purpose is not to learn 1-2-3; it is to learn whether or not a computer can help with marketing," he explains.

Eddie Harris, an instructor at the Software Institute of America, takes a demonstration approach she designed for efficiency. Harris points out that "the 1-2-3 reference manual is one of the best in the industry, but it's not a user's manual; you can't read it cover to cover." People get overwhelmed by the mass of information, don't have the time to wade through it all, and simply need a setting where they can go to learn about the program. She teaches hands-on sessions for some clients but finds that it takes 3 hours or more to do a hands-on Profit and Loss Statement exercise. Yet, she can demonstrate the same example in less than half an hour and can cover far more material in a single day us-

ing this method of instruction.

Many of the participants in these four courses agree with the instructors about the Lotus tutorial: its value is limited because it forces you along a specific path. Some participants, however, believe they would

Participants and instructors in these four courses agree that the Lotus tutorial is of limited value because it forces you along a specific path.

have been lost in the seminar if they had not gone through the tutorial on their own first. The seminars build upon that experience rather than replace it.

Classroom sessions give participants the opportunity to get immediate answers to their questions. They can focus on the

program away from the distractions and interruptions of the workplace. Many also mention the value of the take-home materials because they can use them as guides for their own practice and exploration after they return to their offices.

SEMINAR LIMITATIONS

The seminar approach does have some disadvantages, however. Almost all participants agree that classes are best for orientation and exposure to such advanced concepts as macros, but hands-on experience on the job is the best way to actually learn the program. According to one participant, "Seminars don't intend to make you fluent during the class; the instructors show you how to use a program and then you go back and practice."

Most seminars have handouts and/or disks with sample files that the participants use during the sessions, but they may be of uneven quality. One course simply offers a command reference manual, while another only gives essentially the tables of sample data and reports to be used during the hands-on segments. Another hands out reproduced overhead transparencies used in its presentation, along with some exercise worksheets. As standalone products, the

third type is the most useful. Participants of other seminars say the handout materials can be very uneven; some are poorly produced and riddled with typos and errors, while others are obviously the result of careful and professional effort.

Two of the hands-on courses in the sample group provide sample files on a disk for the participants, yet only one lets them keep the disk to use for practice and review. It is not uncommon for the instructor to keep the sample disks; perhaps they fear that someone will copy their examples and thus steal their course. While this is understandable, it makes it far more difficult for the participant to practice what they have learned after they leave the seminar. The third hands-on course in my sample doesn't have files created on a disk, but participants create files during the course and keep the disk.

Other course handouts include book lists and article reprints on relevant topics. One course even hands out copies of one of the more popular 1-2-3 books as part of the course materials.

Perhaps the biggest problem with training seminars is matching the specific objectives of the course with the expectations of the participant. In many cases, it is ex-

tremely difficult to know in advance what the course offers because the only information you are given is the course title and a few lines of description. Even if you have a list of clear objectives, you may still find that the course doesn't meet them. A relat-

Perhaps the biggest problem with training seminars is matching the specific objectives of the course with the expectations of the participant.

ed problem is that the examples used in these seminars are usually typical financial exercises, such as budget analysis and projection and loan calculations. If your work doesn't involve such applications, you may find it hard to adapt the examples to your own work.

In other cases, participants have ended up in the wrong courses, but they have only themselves to blame—or their managers. Some instructors relate situations where a manager has arranged training for staff without orienting them at all. As a result, the instructor is confronted by a room filled with dazed people. One manager told his staff to take the advanced Lotus course immediately because space was available and that they could take the intermediate course (a prerequisite for the advanced course) at a later time.

LOOK BEFORE YOU LEARN

How can you protect yourself and get the most out of the time and money you spend on program seminars? The first rule is to select the course carefully. You should make certain that you and the course are a good match.

Read the promotional material carefully. If it doesn't clearly list measurable objectives, you should contact the sponsoring agency for pertinent information, such as samples of the handouts and details on what you will take away with you at the end of the session (Note: disks with sample files are a definite advantage). Find out what real-world experience the instructor

has had with the program and what qualifications he or she has to teach the course. Get copies of evaluations or, better yet, the names of past participants, so that you can find out what others think of the seminar.

Here are some additional questions you should get answered before you sign up: Is it a hands-on program? How long does the seminar last and can you expect your attention span to hold up that long? Will the examples used in the session be useful to you in your work? Are there any prerequisites for the course that you have not met?

If you have successfully answered all the above questions and still find yourself in a disaster of a course, you do have some recourse. Only the Boston University Metropolitan College has a money-back guarantee, but you will often find that a polite but firm complaint will earn either a switch to a different (and, it is to be hoped, a more appropriate) course or a full refund. In most cases, your dissatisfaction will result from a misunderstanding, and the sponsor will want to smooth out any problem.

Many instructors invite you to call if you have any questions after the course, but few participants take advantage of the offer. Instructors claim that calls are truly welcome because they offer some direct and personal feedback about the effectiveness of the program and the changing needs of the marketplace.

Classroom training is not for everyone; it is best for those who want to get some exposure to the potential application of a program. If you want to gain specific competencies, you have to make certain that the course not only offers them but backs them up with ample take-home materials.

Don't expect to attend a seminar that lasts a day or two and come out a 1-2-3 expert. Achieving that goal still requires lots of practice, review, and experimentation on your own. If you view the seminar as a springboard from which to launch your learning, you will probably have a successful experience. Be sure to look for the program that will propel you in the right direction and give you plenty of follow-through to help keep you on course.

Look into the new Princeton HX-9 Series

See high-resolution RGB color with the Princeton HX-9 and HX-9E Color Monitors.

Observe exceptionally sharp high resolution graphics and text created by color phosphor dots which are within a mere .28mm of one another.

Enjoy Princeton performance on a 9-inch screen in less desk space than most any other monitor on the market today.

Display images of clearly superior quality

Flicker-free technology enables you to view colorful images with clear, sharp definition. Dark-glass, non-glare screens further enhance viewing clarity.

A built-in green/amber switch allows you to switch from multi-color to either a green or amber mode. It's like owning both a color and a monochrome monitor.

The Princeton HX-9 Color Monitor is perfect for viewing up to 16 vivid colors with the IBM Color/Graphics Monitor Adapter (or equivalent).

And, the enhanced member of the HX-9 Series, the Princeton HX-9E Color Monitor, offers one big extra: It also allows you to use the IBM Enhanced Graphics Adapter (or equivalent) to view up to 64 brilliant colors.

What's more, they tilt. They swivel. Both have a built-in base to adjust your monitor to a comfortable viewing angle.

Princeton quality is built in

Both monitors in the Princeton HX-9 Series are manufactured to provide years of reliable use. Verified by tough quality-control procedures. And backed by a full one-year warranty.

Visit your local computer store today

CAD 3-D DESIGN

Rendering a three-dimensional object on a two-dimensional piece of paper usually means a painstaking reconstruction of the way it looks in three dimen-

sions. Often architects, planners, or engineers must redraw objects as they might appear from different angles. By bringing computer-aided design (CAD) features once available only on mainframes to the PC, low-cost CAD programs have aided

this process. However, until recently such programs lacked a 3-D capability. Among the first to offer this capability, **CADKEY** from Micro Control Systems, Inc., adds true three-dimensional graphics to its fully integrated two-dimensional CAD system.

Figures 1 to 3: (top left and right, bottom left) The progression of prompt and history lines during the creation of a line. Figure 4: (bottom right) An isometric view of the figure.

A powerful graphics system for the PC, CADKEY creates unlimited 3-D views, makes up to 256 overlays, and introduces many other features that make tedious design chores easier.

FROM ANY ANGLE

Without actually redrawing a three-dimensional image, CADKEY allows you to look at it from different angles as though you were holding a model of it in your hands.

CADKEY also automates one of the most tedious and disorderly aspects of

drafting—creating overlays. Once you design the basic floor plan of a room or building, for example, you generally make successive overlays on tracing paper to show plumbing, electrical wiring, lighting, and furniture. When all of these are

finished, you could wind up with quite a pile of onionskin. With CADKEY, you can create the equivalent of 256 layers of tracing paper and use as many as 16 colors. You could also alter a small portion of, say, the electrical plan by calling up the

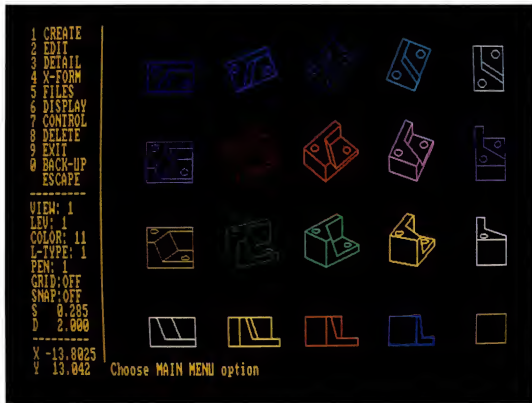

Figure 8: Once you have specified the depth of a 2-D drawing, CADKEY automatically connects the endpoints of the lines. It thus creates a true 3-D image that you can recall in many different orientations on the screen.

electrical level and making your change, without the problems of messy erasing or torn tracing paper.

Engineers and electrical designers as well as architects and space planners can benefit from the program because it can store and use all types of symbols. Moreover, CADKEY is fast, easy to use, and extremely powerful. Although it's completely menu driven, it offers a combination of function-key and Alt-key sequences to bypass or enhance menu choices.

Using Windows

CADKEY's design reflects the way people really work. For example, to avoid a confusing array of commands, CADKEY "windows" the screen into several functional areas. These information windows are placed at the left of the screen since, in

normal reading, your eyes scan from left to right. At the upper left is the menu options window, which contains the main menu at start-up. As you make selections from this menu, additional menus appear, present-

CADKEY lets you look at an image from different angles as though you were holding a model of it in your hands.

ing further choices. You use either function keys or the cursor (controlled by mouse or digitizer tablet) to make your choices. The menus can be modified.

Located just beneath the menu options window, the status window contains infor-

mation about the current display. This window includes the level, color, line type, scale, and view number, which keeps track of the unlimited number of views you can create. Directly below this, the cursor tracking window displays the x,y coordinates of the cursor.

The largest window on the screen is the drawing window. Besides displaying detailed drawing views and the cursor location, this window contains a history line at the top of the screen and a prompt line at the bottom. The history line tracks your actions so that you always know what you've done, and the prompt line asks you for your next choice. This information is quite handy, since it allows you to orient yourself and continue quickly after an interruption. Figures 1 through 3 illustrate the progression of the prompt and history lines

CADKEY's Main Menu Functions

Powerful features at the heart of CADKEY make it easy to draw and organize the varied parts of a complex design project.

CADKEY's effectiveness comes from the simplicity of its command structure. Each main menu function—there are ten—corresponds to a function key and can be invoked by that key. To use the program, you combine these function keys with keystrokes denoting "immediate" mode commands into a sequence that takes you to the program's deeper levels as you make your choices more precise. These sequences are so simple that they quickly become second nature. However, you can also select functions by moving the cursor with a mouse or digitizer tablet. The full list of main menu functions is given here, along with a few examples of submenu choices.

F1

Create displays the six drawing choices: line, arc, circle, point, rectangle, or fillet. Selecting any one displays immediately a third menu that asks how to construct the particular entity. For example, selecting **Circle** displays a menu with five methods of construction: center plus radius, center plus edge, three

points, tangent, and two points. Choosing any one of these options displays the appropriate prompt for drawing the shape.

F2

Edit trims or extends existing lines or arcs or recalls deleted entities. Edit's **Trim** function is view dependent. If two lines look as though they intersect, Trim treats them as if they do and locates their intersection. **Recall**, also known as an "oops!" recovery, retrieves the last entity deleted.

F3

Detail allows the application of dimensions, labels, and notes that conform to either ANSI or ISO standards. It makes automatic dimensioning available for linear and angular lines, arcs, and circles, along with arrows and witness lines.

Dimensioning a line is simply a matter of indicating the starting position for the first witness line, the second witness line, and the location of the text. Instantly, two witness lines are drawn, and the

distance between them is displayed with arrows. The prompt now asks for the next line to be dimensioned; you can continue dimensioning lines without reselecting from the main menu again.

The **Detail** function also includes a text mode, which governs the text height, arrow locations, number of decimal places allowed (up to four), font (box or slanted), and number of witness lines. All of these can be preset and will remain until changed.

F4

X-Form (for transformations) changes the size and/or orientation of geometric entities.

You can translate entities from one location to another by selecting the appropriate x, y, z coordinates, or by referencing an old and new base position. Alternatively, you can use the Copy command to move or copy objects to a new location, or to draw objects repetitively at various locations on the screen. These objects can be rotated about an axis going into the screen (2-D rotation) and scaled to any size.

during the creation of a line.

Since menu-driven programs are often slow, users tend to accept slowness as the price for ease of use. *CADKEY*'s menu bypass for experienced users greatly enhances its speed. For example, to create a line by defining its endpoints, using the key sequence Esc-F1-F1-F1 will place you at the same point as the Create, Line, and Endpts menu choices. Pressing the escape key always returns you to the main menu, and you can also use it to end a command or back out of an incorrect sequence of commands.

A good test of a program's "friendliness" is to see how much you can accomplish without resorting to a look at the manual. *CADKEY* let me draw a fairly complex, two-dimensional multiview part, dimension it, then save it to disk

without having to refer to the manual at all. The prompt lines were sufficient, and I quickly found myself using the function-key shortcuts.

To avoid a confusing array of commands, *CADKEY* "windows" the screen into several functional areas.

Immediate-Mode Commands

CADKEY's immediate-mode commands are a unique feature. These 24 commands include automatic scaling, color, cursor tracking, English/metric conversion, level, line type, redraw, scale, view,

and window. You can call them at any time from anywhere in the program. Suppose, for example, that you want to measure the length of a line. The prompt line displays "select first endpoint," which you can easily indicate by positioning the cursor where you want the line to end. The prompt line next displays "select second endpoint," but suppose the second endpoint is close to a series of lines and cannot be easily distinguished. You could escape to the main menu, redraw the area to a larger scale, and repeat the measurement sequence, but an easier solution would be to select the immediate-mode function Alt-W (alternate window) at the second prompt. Alt-W defines a window around the area in question, and *CADKEY* then redraws the selected area to fill the screen—greatly expanding its scale and spacing the

F5

Files saves or retrieves information files.

CADKEY supports three types of information files: part, pattern, and plot. A part file contains the basic information about a part or drawing and can be stored or retrieved at any time. A pattern file is a part-independent file containing entities that can be inserted into a part file. If you were using *CADKEY* to design logic circuits, oft-used components such as AND gates, OR gates, decoders, resistors, capacitors, and others could be stored as pattern files and quickly recalled to their proper position on the screen. Plot files are files that code a part or pattern for plotting. Once stored, these files cannot be recalled to the screen and can be viewed only by plotting them.

F6

Display lets you manipulate a drawing without permanently affecting its point coordinates. It features a powerful **Zoom** function that enlarges a portion of the displayed drawing so that you can examine it in finer detail. The zoom func-

tion can be called repeatedly to add almost infinitely detailed resolution.

Display's other features allow changing the current view or level, redrawing the display, adding a display grid to the screen, and "snapping" between positions a known distance apart. A **Pan** function, which redefines the center of the display, relocates the display window. The **View** function, which deserves special mention, incorporates eight built-in views: top, bottom, front, back, right, left, and two isometric views. Together, these views allow the three-dimensional object to be seen in all the standard positions. However, you can create an unlimited number of views at any angle or rotation. Instead of actually rotating the image itself, *CADKEY* rotates your viewpoint, or position, around the image. Any view can be used for drawing, dimensioning, or measuring, and all views are automatically numbered and updated.

F7

Control functions help you locate and alter a select portion of your drawing.

They include **Verify**, which displays the attribute and coordinate data of a selected entity—useful in determining on what level a particular entity resides; **Attribute**, which allows you to view or change features such as color, line type, and width, and controls the pen number for multiple-color plotters; and **Toggles**, which switches between English and metric units and displays the cursor coordinates.

F8

Delete removes unwanted entities from a part of the display by selection or level. Single entities, a window of entities, selected levels, or the entire display screen can be deleted.

F9

Backup lets you back out of the last command you selected.

Escape always returns you to the main menu, regardless of your position in the program. Backup and Escape always remain in the main menu area, even when submenus are displayed.

—Harv Weiner

Internal 20 Meg \$599 External 20 Meg \$749

The affordable PC20 hard disk system is one of the most IBM compatible setups around—you'll be able to boot directly from the quiet, 3-1/2 in. drive. This highly reliable and rugged drive uses plated media. Our free software lets you get the most out of your hard disk—1dir organizes directories with a visual shell that speeds operation and frees you from the intricacies of DOS commands. And our exclusive 5-1/4 in. controller fits into a short slot—perfect for computers like the Tandy 1000, Panasonic Sr. Partner, and IBM Portable PC. PC20 comes complete with a low power drive, controller, bezels, cables and illustrated instruction manual.

3-D DESIGN

lines farther apart. The prompt for the second endpoint now appears again, and the measurement can be completed. At this point, you can use Alt-V (alternate view) to change the angle from which you view the lines or objects, then scale the drawing automatically with the Alt-A (alternate autoscale) sequence.

Other Features

CADKEY includes many powerful features usually found only on mainframes. It automatically uses all available computer memory, and when RAM is full, it dumps the additional file contents to floppy or hard disk. This method allows it to handle file sizes in megabytes. CADKEY uses 32-bit floating-point numbers to calculate the distance between points. Unlike integer-based calculations, those with floating-point numbers allow very high image resolution for drawing precision and unlimited scaling capability. All menu, prompt, and status files are stored as text files on the system diskettes and are easily modified with a text editor or word processor. This separate storage means that prompts can be changed for specific applications, or all text can be converted into a foreign language.

In many CAD systems, selecting an entity such as a line, point, arc, and so on is time consuming. Searching through a large file to find these entities reduces the system's overall response time. By scanning only those levels of the drawing that appear on the screen, CADKEY can find any entity in a 2,500-entity display within 1.5 seconds.

Plotting has always been a problem on PC-based systems. Many systems inhibit rapid plotting while you are designing on

PC FACT FILE

CADKEY 1.1

Micro Control Systems, Inc.
27 Hartford Turnpike
Vernon, CT 06066
(203) 647-0220

List Price: \$1,895; program updates for 1 year, \$200

Requires: 512K RAM, DOS 2.0 or greater, two floppy disk drives, color/graphics card.

CIRCLE 635 ON READER SERVICE CARD

the same computer. In addition, they require that you reformat a drawing each time you change plotters. **CADKEY** creates device-independent plot files that have a universal output format and can be used only for plotting output. This method allows plotting to be accomplished on another PC, or even a low-cost PCjr., without tying up the workstation. (All drawing files for actually working on-screen are created in ASCII format.)

The utility that creates these plot files is a **CADKEY** plotting program called **PLOTFAST**. A menu-driven program that

By scanning only those levels of the drawing that appear on the screen, **CADKEY** can find any line, point, or arc within a 2,500-entirety display within 1.5 seconds.

can be configured for a wide variety of plotters, **PLOTFAST** operates independently of the main program. Screen dumps to a dot matrix printer can be obtained at any time in **CADKEY** itself by using the immediate-mode command Ctrl-Q.

CADKEY conforms to drawing standards established by the American National Standards Institute (ANSI) and the International Standards Organization (ISO). Optional features include 2-D and 3-D IGES (Initial Graphics Exchange Standard) file compatibility, needed to transfer part files from other CAD systems. Meeting these standards enables **CADKEY** to fulfill the requirements for an inexpensive remote CAD workstation.

Copy Protection

CADKEY uses an interesting copy-protection scheme. You must install a Software Interface Module in one of the computer's expansion slots. The software checks to make sure that this hardware security device is in place every time you boot the program. Though it does tie up a slot, this device allows you to use the **DISKCOPY** command in DOS to make

BT60 Streamer \$895 The Stack \$999

Don't suffer the loss of losing data. **BT60 Streamer** uses a half-height streaming cartridge tape unit that runs on a 5-1/4 in. controller card. Menu-driven software makes it easy of use. Copies up to 60 Megs on one tape at an amazing 5 Megs per minute! Recommended for systems with at least 130 watt power supplies. **The Stack** includes our PC20 internal hard disk system and the BT/SP10 tape backup system. BT/SP10 plugs into the floppy controller card--no extra slot needed--and is accessed like a floppy. It uses spools of tape (\$12.95 each or 5 for \$49.95) that hold up to 10 Megs each. Software provided allows you to back up the PC20.

3-D DESIGN

unlimited backup copies of the software. An optional external security device is also available. When inserted in series with the keyboard connector at the rear of the computer, this external device ensures the same level of security but frees the expansion slot inside the computer.

Installation

Installing CADKEY is straightforward but requires hardware setup and software configuration. The hardware portion consists of setting the proper switches on peripherals, then interfacing them to the computer. Since there is no universal configuration for an RS-232 serial port, some difficulty in hardware installation can arise. In my case, the gender of the connector on my mouse was the same as the one on my serial card, requiring me to construct a gender changer (two sockets wired back-to-back) before the mouse could be connected.

To install the CADKEY program itself, you use a menu-driven CONFIG program that tells CADKEY which display screen, display card, and tablet or mouse you are using. You can also establish the color of the menu text, screen dimensions, tablet resolution, and cursor size. To change the given information, simply rerun CONFIG from the disk directory at any time.

You start your design session by entering the name of a part file. This part file can be a previously drawn shape or a new part to be created. You then make your first selection from the main menu (see sidebar, "CADKEY's Main Menu Functions").

Creating an Image

A simple application best illustrates CADKEY's simplicity and power. Let's assume, for instance, that you want to draw a spacer block 2.25 inches wide, 1.875 inches high, and 0.88 inches thick with several holes. After booting the system, you would enter the part name SPACER at the prompt. You then select Create Rectang Wid/Ht from the main menu (Esc-F1-F5-F2) and enter the width and height dimensions of the rectangle at the prompts. Next you select the position on the screen where you want the image to appear, and CADKEY instantly draws a rectangle. To continue, you return to the main menu and

select Create Fillet Trim (Esc-F1-F6-F1); at the prompt, enter the fillet radius of 0.25 inches. You can then select the lines where you want the fillet to be inserted, and, as you designate each corner, CADKEY inserts a 0.25-radius fillet.

To position the holes, you return to the main menu and select Create Circle Ctr+Rad (Esc-F1-F3-F1), indicating the radius of the holes to be added. Use the cursor to indicate the position of the centers, and CADKEY draws the holes.

Now the advantages of the 3-D feature of the program become apparent. Instead

Once you have gained some familiarity with CADKEY, you should need the manual only for an occasional reference. Considerable proficiency can be achieved without using the manual at all.

of having to draw lines to indicate the third dimension, you simply return to the main menu and select X-Form Trans-R Join All Dsp (Esc-F4-F1-F3). This sequence tells CADKEY that you want the spacer block to be 0.88 inches deep. By automatically connecting the endpoints of the lines, CADKEY has created a true 3-D image. If you now want to see different views of the block, you can indicate what angle you wish to see it from by hitting different keys. For example, to see an isometric view, you can invoke the immediate-mode command Alt-V and select view 7. If the view is not centered on the screen, the immediate-mode command Alt-A will re-scale the entire part or image and indicate the scale in the status window. The part can now be saved as a "pattern" file and inserted into a blank drawing in the views desired. In this way, a front, top, side, and isometric view can be created on one sheet with a minimum of effort. These views are then saved as a part file and as a plot file for output to a plotter. Figure 4 shows the part in an isometric view, and Figure 5 shows how a pattern can be recalled to the screen in many different orientations.

Enhanced Keyboard ff5151 \$159

An affordable, productive solution to your non-standard keyboard. ff5151 uses solid-state capacitive key switches—giving you tactile feedback through your fingers. Avoid Num Lock confusion with our separate cursor control and numeric keypads and LED indicators on the Lock keys. We've returned keys to their standard setup including an extra wide Control key adjacent to the A for Wordstar users. Other features include an extra Control key in the function key row, 3-position height adjustment and sleek color matched styling. Plugs into IBM PC, PC/XT and Compaq Desktop.

You can add notes, dimensions, and labels at different levels and in different colors and display these levels individually or in groups. To avoid forgetting where entities are stored when you have many levels,

you can use the Verify menu option, but it is good practice to establish groups of levels for various features. For example, actual part construction can occur on levels 1 to 99, dimensions on levels 100 to 150, text

on levels 151 to 200, and so on.

Documentation

The manual, divided into tabbed sections so that you can locate information quickly, is very well written. The "Setting Up" section provides complete information for setting up digitizers and plotters and includes specific model numbers, switch settings, connector pinouts, and information on troubleshooting. This section also describes the installation and operation for the copy-protection device of the CONFIG program.

The "Getting Started" section explains the various windows and symbols used and the coordinate systems. Other sections contain detailed information on entity se-

It may sound too
good to be
true, but
CADKEY delivers all
that it promises.

lection and position indication. All major functions are clearly described, and a tutorial introduces the basic building blocks of the CADKEY program. An appendix contains hardware requirements, definitions, immediate-mode command listings, and a complete set of flowcharts depicting the various levels of each menu command.

Mainframe Capabilities

However, once you have gained some familiarity with the program, you should need the manual only for an occasional reference. Considerable proficiency can be achieved without using the manual at all. The CADKEY package also contains two demo disks that demonstrate the program's capabilities and perform all functions except part filing.

It may sound too good to be true, but CADKEY delivers all that it promises. With no significant flaws or omissions, it puts a sophisticated 3-D CAD system with mainframe capabilities into your hands at a reasonable price. ■

Harv Weiner is a microcomputer consultant and a contributor to several microcomputer publications.

AMAZING DAISY

NOW! FULL SIZE, FULL FEATURE, LETTER QUALITY AT ONLY \$353

If you have been searching for a letter quality printer you probably found that the flood of claims and counterclaims were a real roadblock in your search. Not long ago we were in the same position. We tried to determine which daisy wheel printer had all the features anyone could want, but would also appeal to the cost conscious buyer. Recently several manufacturers introduced printers that had features we were seeking. After a thorough assessment we eliminated all but one which precisely met our qualifications.

THE RESULTS ARE IN

We found the printer which has all the features anyone could want. We've named it the Aprotex Daisy 1120, a real heavy-duty workhorse printing at 20 characters per second. The manufacturer is Olympic Co. Ltd., a highly respected Japanese firm.

FEATURES GALORE

This printer has it all. To start with, it has a front control panel with indicators for Pitch Selection which allows for 10, 12, or 15 characters per inch (CPI) or Proportional Spacing. There is a Select (Online) button (with indicator) and a Line Feed button. You can also set Top-of-Form or Form Feed with the touch of the TOF button. Other front panel indicators include Power and Alarm.

To load a sheet of paper, simply place it in the feed slot and pull the paper bail lever. The paper feeds automatically to a 1 inch top margin and the carriage aligns to the selected left margin. In this manner, each page can have identical margins.

You can continue to use your PC while the Daisy 1120 is printing. The built in

2K buffer allows a page or two of concurrent printing and use of your computer for the next job. To really take advantage of your printer's optional features, the automatic Cut Sheet Feeder eliminates tiresome paper handling. Also available is the adjustable Tractor Feed option. *Compare our option prices!*

Best of all the Daisy 1120 is quiet: only 57 dB-A (compare with an average of 62-65 dB-A for others).

COMPLETE COMPATIBILITY

The Daisy 1120 uses industry standard Diablo® compatible printwheels. Scores of typeface styles are available at most computer or stationary stores. You can pop in a 10, 12, 15 pitch or proportional printwheel and use paper as wide as 14". At 15 CPI you can print 165 columns—a must for spreadsheets.

The Daisy 1120 uses the Diablo Hytyle II® standard ribbon cartridges. Again universally available.

Not only is the hardware completely compatible, the control codes recognized by the Daisy 1120 are Diablo 630® compatible (industry standard). You can take advantage of all the great features of word processing packages like Wordstar®, pfs: Write®, Microsoft Word® and most others. This allows you to automatically use superscripts, subscripts, automatic underlining, bold-face (shadow printing) and doublestrike.

The printer has a set of rear switches which allow the use of standard ASCII as well as foreign character printwheels. Page length can be set to 8, 11, 12, or 15". The Daisy 1120 can also be switched to add automatic line feed if required.

THE BEST PART

When pricing a daisy wheel printer with all these features (if you could find one), you would expect to pay \$600 or \$700 dollars. The options would add much more, but our exhaustive research has paid off for you the PC user. We can now offer this printer for only \$353. Order yours today!

NO RISK OFFER

Try the Daisy 1120 for 2 weeks. If you are not satisfied for ANY reason we will refund the full price—promptly. A full 1-year parts and labor warranty is included. Another indication of quality and reliability.

THE BOTTOM LINE

Aprotex Daisy 1120 (Order#1120) \$353 w/standard Centronics parallel interface and 2K buffer.

Options

Auto Cut Sheet Feeder (#1110) \$188

Tractor Feed (#1112) \$77

APROTEK
1071-A Avenida Acasoa, Camarillo, CA 93010
CIRCLE 104 ON READER SERVICE CARD

The world's best selling monochrome graphics card for the IBM PC.

There are more Hercules® Graphics Cards in more IBM® PCs, XT's and AT's than any other monochrome graphics card in the world.

Over a quarter of a million demanding users around the world use a Hercules Graphics Card to improve the performance of their software.

The Lotus® 1-2-3® Booster.

Consider Lotus 1-2-3. Hercules gives an off-the-shelf

copy of 1-2-3 the highest resolution possible on an IBM

PC, XT or AT. More 1-2-3 users choose the Hercules Graphics Card to get crisper text and sharper graphics than any other monochrome graphics card.

And we bring the same performance to other integrated programs like Symphony®, Framework®, and SuperCalc®3.

But we don't stop there. The Hercules Graphics Card

improves all kinds of software.

Like Microsoft® Word, a word processor that enables you to display text with subscripts, superscripts and italics.

Or pfs: Graph, an easy-to-use business graphics program that converts your data into presentation quality graphs.

Or Microsoft® Flight Simulator, the high flying game for the overworked executive.

Or our own Graph X®, a library of graphics sub-routines that eases graphics programming.

Or AutoCAD®, a computer aided design program that offers features normally associated with expensive CAD systems.

And we supply free software with each card to do hi-res graphics using the PC's BASIC interpreter.

State-Of-The-Art Hardware.

The Hercules Graphics Card gives you graphics resolution of 720h x 348v and a

parallel printer port. Our unique static RAM buffer provides sharp 9 x 14 characters and flicker-free scrolling. Our exclusive safety features help

prevent damage to your monitor.

State-of-the-art custom IC technology delivers unsurpassed reliability. Ordinary graphics cards use up to 30 ICs to do what one Hercules IC does. By using fewer parts, we reduce the possibility of component failure.

Which is one reason we warranty the Hercules Graphics Card for two years.

Unbeatable reliability. Advanced technology. Proven by over a quarter of a million users. Why settle for anything less than Hercules?

Call 1-800-532-0600 Ext 400 for the name of a Hercules dealer nearest you and we'll rush you our free info kit.

Hercules.
We're strong on graphics.

Core's Hard Disks: WORKHORSES of Performance Computing

Core International's big, fast, tough add-in mass-storage systems for the AT use proven technology to gain speed, quadruple capacity, and avoid the problems said to plague the AT's factory-issue hard disks.

Running a floppy disk-based AT system makes about as much sense to me as betting on a three-legged horse to come in first in the Preakness. The AT comes into its own only in performance computing—where results are more important than mere dollars—and where a floppy disk would seem to be a hindrance.

It comes as a surprise, then, to find that nearly half of the AT sales so far have been for floppy-only systems. The smart money, according to some experts, was being spent on the cheaper machines for two very good reasons: First, the initial short supply of enhanced ATs created waiting lists that stretched months beyond the horizon. Second, horror stories about hard disk malfunctions—whether true or not—frightened off even the most loyal fans of the boys from Boca Raton.

But even without these reasons, purchasing an AT sans Winchester can be an astute strategy if you buy one of the AT-plus series of add-in hard disk drives from Core International. Core promises a big, fast, tough mass-storage system without

the problems often attributed to the AT's factory-issue hard disks. Moreover, these Core drives can also expand an enhanced AT's native hard disk endowment, doubling or nearly quadrupling its straight-from-the-factory storage capacity.

The two Core drives I reviewed represent opposite ends of the ATplus product spectrum. The plus20 is as close to a direct replacement for IBM's own hard disk choice as you can get. The plus72 is Core's flagship unit, stuffing about three and a half times the megabytes of an ordinary AT hard disk into a package of the same physical size.

When tested, the drives matched most of their maker's claims. Both proved easy to install and operated perfectly. In fact, the biggest flaw was the optimism reflected in plus72's name—the number refers to unformatted disk capacity. Formatted, it stores only 66,879,488 bytes (split between two partitions). The plus20 is more appropriately named: it holds a total of 21,309,440 formatted bytes.

Adding a Winchester to an AT is not as simple as doing so for an older PC, into

which you can plug nearly any disk that spins. Getting the high performance that everyone—including IBM—expects from the AT requires a very high-performance hard disk. In fact, one of the principal rea-

sons why IBM chose Computer Memories, Inc. as a supplier for its AT line was that the new design of its drives offered low price combined with high speed, which could help make the AT both a price

and performance leader.

CMI's innovative mechanical engineering cut the average access time (how long it takes the read/write heads that fly over the hard disk to move between random tracks, settle down, and start reading) to under 40 milliseconds. Compared to the PC-XT's hard disk, whose average access time is about 110 milliseconds, that's a blazing performance, indeed. Few low-priced hard disks can even sort between tracks within 70 milliseconds (the XT takes over 100); hence the average bargain-basement hard disk impedes the performance the AT is capable of.

Unfortunately, the novel technology of the CMI drives is thought by some to be one of the AT's hard disk weaknesses. The Core drives avoid innovation, using proven technology so as to eliminate every possibility of a problem. That design objective is achieved with some impressive, heavy-duty hardware.

The Core of the Matter

Sturdier hard disk drives than the AT-plus are difficult to imagine. Both Core units tested are massive, full-height drives solidly built by Control Data Corporation. The shells that cover the disk platters themselves are heavy aluminum castings, differing from one another only in that the plus72 forms a solid rectangle, while the plus20 is a half-circle with a few radial heat-sinking fins. Both are finished in natural aluminum.

Unlike the AT's standard CMI drive, most of the electronic circuitry in the AT-plus units is physically protected. The primary electronics of the ATplus drives are tucked on the bottom. A heavy stamped and perforated steel cage covers the boards and prevents just about any foreseeable damage to their components. Though the

WHO SAYS WORDSTAR 2000 IS SO GREAT?

"Move over MultiMate, MicroPro's back on top."

— *Business Software*

"The new package is packed with virtually dozens of features everybody wants... Even in a dedicated machine, word processing has never been more plushly self contained and comprehensive."

— *Personal Computing*

"Three early users of WordStar 2000 gave the program high marks for its overall design, mnemonic command set and intelligent use of function keys."

— *ComputerWorld*

"I've become addicted to some of the features such as undo, windows, and automatic reformatting."

— *Popular Computing*

"Include WordStar 2000 on your shopping list — it's competitive with anything now on the market"

— *Computers and Electronics*

ATplus HARD DISKS

plus20 sports the unprotected bottom of a printed circuit board on its front face (much like the CMI does), no electronics show on the plus72. Not even the drive motors are visible. Manhandle either AT-

plus drive almost any way you want during installation, and it shouldn't be any worse for the wear.

The disadvantage of this sort of construction is that covering up all the compo-

nents makes them hard to get at when servicing. On the other hand, covering up the works generally prevents the accumulation of dirt that might make such service necessary. The point is probably moot, because most hard disk servicing consists of directly replacing the whole drive and leaves digging into the actual innards to the factory folk.

The ATplus drives differ from most by using rotary voice-coil head positioning—a proven Winchester mechanism most often found on high-performance 8-inch units. The primary advantage that voice-coil positioners have over the more com-

Manhandle either of the two ATplus add-in hard disk drives almost any way you want during installation, and it shouldn't be any worse for the wear.

mon band-stepper mechanisms, such as those found in PCs, is speed. Voice-coil positioners are what makes the performance of the ATplus drives so brisk.

An additional benefit from voice-coil technology is relative freedom from head crashes. While the drive is in operation, the voice coil is constantly kept in an energized state so that it pulls the head into the correct position above the disk, always against the tension of a spring. If perchance the power should fail, the spring automatically and almost instantaneously retracts the head away from the area of the disk used for data storage, so that no harm is done once it touches down. Moreover, the head is locked into its retracted position so that an inadvertent bump when your computer is off won't send it skating across the disk surface, plowing a furrow in your files.

The plus20 sports one additional disk protection feature not present in either the plus72 or the standard AT-issue CMI drive—a manual head lock on its back. Pulling out a small metal arm mechanically locks the read/write heads in place so that absolutely no damage will befall them or the disk surface during shipping.

ATplus HARD DISKS

Unfortunately, once the drive is installed, the lever is hidden inside your AT, where it is difficult to reach. Digging into your computer to lock the heads is not worth the effort unless you decide to ship

your AT across the country by stagecoach. When the test unit arrived, this slide was not in the locked position. If Core doesn't think much of locking the head, maybe you shouldn't either.

Putting the Core in Its Place

Physically installing the two ATplus hard disks tested entailed essentially the same procedure, made easy by IBM. In designing the AT, IBM evidently recognized the inadequacies of the XT's disk drive mounting scheme (two screws) and developed a system that was sturdier and, in some ways, easier to install.

To install any hard disk drive in an AT, simply pull the top cover off and remove the two small retaining brackets on either side of the drive slot you decide to use. Next, just slide the drive into the open hole in the front of the chassis. A guide rail on

ACCOUNTING FOR MICROS

\$395 Set of Four

\$325 Set of Three

\$465 Set of Five

ACCOUNTING FOR MICROS is a simple, integrated accounting program which meets professional standards. They're fast and easy to use, with simple instructions. Our manual (shown above) also includes helpful information on bookkeeping and computers.

GENERAL LEDGER \$125
Allows up to 1,000 accounts & 1,000 transactions/month. Returns month-end balances for last year, this year and forecast. Includes Cash Disbursements, Cash Receipts and General Journals. Reports include Balance Sheet, Income Statement, Annual Summaries and Journal Reports.

ACCOUNTS RECEIVABLE \$125
Allows up to 2,500 customers and 1,000 invoices per month. Invoicing can access Inventory Module. Keeps customer names and addresses. Invoices print on plain paper or any pre-printed form. Statements can be printed at any time.

INVENTORY \$125
Allows up to 4,000 parts. Keeps 3 month history of unit sales as well as year to date. With AR, can be used as point of sale system (prints invoices, handles cash). Reports include Inventory Value and Stock Report, Internal and Customer Price List.

ACCOUNTS PAYABLE \$125
Allows up to 1,000 vendors. Prints invoices, bills, and purchase orders. Handwritten checks, computer checks or any pre-printed form. Keeps vendor names and addresses.

PAYROLL \$125
Will handle up to 100 employees with eight deductions per employee. Deductions may be determined as fixed dollar amounts or percentages, or referred to a table for automatic look-up. Tax tables are easily entered, or purchased separately. Prints checks and W2s.

SET OF FIVE \$465

DEMO DISK \$18.00

Try all 5 programs above (GL, AR, AP, IN, PY). Order our DEMO DISK for \$18.00 (includes shipping). Condensed versions of the programs give you the "feel" of data entry and access. Includes sample reports and instructions. Specify machine.

TMAN \$125
The "Catch-All" program. Files any type of information for quick access. Name or subject oriented with 15 lines of notes per name. Use TMAN as a mailing list, filing system, notebook, etc. Can be used alone or with data from our other programs.

Try TMAN DEMO \$18

HOW TO ORDER: Please specify machine and disk format. You can pay by check, by VISA or MasterCard (we need your expiration date and card number), or by UPS COD (add \$2.50 COD charge). Our price includes shipping. Minnesota residents, add 6% sales tax. We ship most orders the same day.

OR ORDER BY PHONE: 612-336-2521

The AT comes completely equipped with the proper cables and connectors for installing one hard disk drive already stuffed inside.

both sides aligns the drive in the slot and, because of the tight fit, holds the drive securely in place.

Before you slide the drive all the way in, however, you must connect the necessary wiring. One wide ribbon cable carries the data from the drive to your computer, a narrower ribbon cable from the computer conveys the instructions that tell the drive what to do, a connector with four wires supplies the drive with its lifeblood electricity, and a single black wire grounds the drive chassis to your computer.

In theory, all these connections should be straightforward. The AT comes completely equipped with the proper cables and connectors for installing one hard disk already stuffed inside. All you need to do is match the proper connector to its mate on the drive. The different sizes and styles of connectors ensure that you can't go far wrong.

The drive control and data connectors are keyed with small plastic tabs inside so that they cannot be inadvertently plugged in backwards. Alas, the tiny key can fall out of the connector and ruin IBM's good intentions. In fact, the key was not present in the control cable of my test AT.

Every software creator hopes to get great reviews.

Bob Hamilton got a medal for Enable.

"When PC Magazine's editors first saw Enable, we yawned. JAIP," we said (Just Another Integrated Package). Okay, the spreadsheet was powerful. And yes, the graphics were sharp. And the word processor wasn't bad. Then the demonstrators took a graph and merged it into a text file. Not bad. Then they edited it. That was too much. 'You can't do that,' we said.

'Enable can,' they replied. And that's the real story behind Enable: Its creator, Bob Hamilton, was determined not to introduce a me-too product to a field that was soon to be swamped by lookalikes."

Comments by Bill Machrone, the editor of PC Magazine, during the presentation of the magazine's First Annual Awards for Technical Excellence, Comdex, May 7th, 1985.

Will Your PC Handle a Volume Larger Than 32MB?

280 MBytes in one volume

Emerald Systems has broken the 32 MByte DOS barrier and shattered popular attitudes about the performance of micro computers. Our disk drives will easily handle a single logical volume up to 280 MBytes in size (unformatted) on the IBM-PC, XT, AT* and compatibles. Speed? Emerald drives aren't just fast, they're *FAST*—no more trips to the coffee pot while files load.

Emerald delivers the "extras"

The extras means support of the most popular Local Area Networks, password access, support of the VENIX, XENIX, QNX, PC/IX and DOS 3.x operating systems, and user configured, main-frame style, disk caching. Plus, you're not limited to one volume—use up to 24, if you need them, even on one physical disk. You can even spread one volume across two drives. You can have up to 240 MBytes of formatted storage in-board your PC. Or, you can insert an Emerald sub-system, with integral backup and six PC expansion slots, right under your monitor, without increasing your PC's "footprint" even one inch.

Backup protection

Backup of large files is mandatory. Emerald can supply you with 1/4 inch, 60 MByte, cartridge or 1/2 inch, reel-to-reel, backup systems. The 1/2 inch system can even translate your mainframe (EBCDIC) files to ASCII.

Emerald
Systems Corporation

When operated under Emerald's Backup and Restore Utility (BRU) software, both backup files automatically, allow streamer or file oriented operation and file by file access of data. And, they do it fast—our 1/4 inch tape drive operates at 5.4 MBytes per minute. That means you can backup 60 MBytes, on one cartridge, in 11 minutes.

Cost Effective

Emerald products translate directly into dollars and "sense." Why pay mainframe prices to do a job your PC can accomplish for a fraction of the cost?

Still not convinced?

Why don't you pick up the phone? Dial (619) 270-1994, and ask to speak with an applications engineer. You can find out about our large installed customer base, learn about some of the applications environments our systems are performing in, or just request literature. We'll even give you references in your area. Find out what your PC can do with a logical volume bigger than 32 MBytes.

ATplus HARD DISKS

Fortunately, the IBM design follows a simple rule: a slot on the disk drive's edge connector corresponds to the side of the ribbon cable that is edged in color (usually blue). Match the colored edge to the slot, and you'll have it right.

However, what complicates installation is that you have a choice of two data connectors attached to the wide ribbon cable. The one with a section of the ribbon

Although IBM supplies no control cable for a second drive, Core includes one with every hard disk it sells.

cable twisted near the connector is the proper one to use on the C: drive, which is the first hard disk you install. The other data connector is used for the second hard disk in the system.

Although IBM supplies no control cable for a second drive, Core includes one with every hard disk it sells. To add a Core as the second hard disk in your AT system, simply plug one end of this extra cable into the hard disk and the other end into the vacant header—a double row of gold-plated pins—on the disk controller card, then plug the remaining connectors that are loose in the computer into the drive.

The Core plus72 drive that I tested matched with all the IBM cabling perfectly. The plus20 missed perfection by just one connection—it had no matching lug for the black IBM grounding wire. Apparently a brass screw post on the back of the plus20 is supposed to serve as a lug. Since Core didn't supply a screw for this post and I didn't want to cut the wire of the test AT to mate with the provided post, I did not connect the ground wire when I installed the plus20. The system seemed to work properly without it.

As delighted as I am with the AT's improved means of mounting the disk drive, I'm disappointed with the delicate manipulations the design requires you to make to connect these cables. Hooking everything up is an experience akin to installing a car radio: Although you know that everything will look and sound right in the end, you've got to squeeze your hand into very

tight quarters around some sharp sheet metal edges that will almost inevitably bloody your knuckles during the installation.

Once you make all the connections, you need only push the drive all the way back into its slot and reinstall the two small retaining brackets, ensuring that they press firmly against the drive's guide rails. The drive will then be locked tightly in place, perhaps forever. In the case of the plus72, I was afraid for a while that the hard disk might indeed become a permanent addi-

tion to the test AT. The fit was so tight that I needed a crowbar to pry it out of the computer. It had stuck about halfway out, requiring abnormal persuasion and two pairs of hands to extract it successfully.

Upping the Chip Ante

Once you're past the hurdle of getting the hardware in place, Core plus20 installation follows the same standard IBM operating procedure as if it had been built into the AT at the factory. First you must configure your system for drive type by select-

ing the setup procedure from the diagnostics menu. Answer the question about the hard disk drive type by telling your computer that the Core plus20 is a type 2 drive, identical to the factory-issue CMI unit.

As with the official drive, after setup you must partition the hard disk using the DOS FDISK utility, then format it under DOS 3.0 with the FORMAT utility. If you use the /S option to the FORMAT program, your system will be able to boot from the Core hard disk.

Matters are more difficult with the Core

A PROTOTYPE FOR YOUR PROTOTYPES

METHODS BY DIGITAL. A SMALLTALK PROGRAM DEVELOPMENT ENVIRONMENT FOR THE IBM PC. AN OBJECT-ORIENTED SPEED DEMON. AN EXCITING WAY TO PROGRAM.

Think about your problem. Browse the Methods Smalltalk source code. Select some building blocks like pop-up menus, windows, text-editors and dictionaries. Put them together. Try it. Oops, Methods tells you something is missing. No problem. Continue thinking, changing and trying. Now you're prototyping! Try out new ideas. Redefine your problem. And you don't have to throw this prototype away. Refine it until you like the finished product.

Methods by Digital. A new way to develop software for the PC. Use it for windowing, simulation and artificial intelligence applications. Use it by prototyping.

Methods is Smalltalk-80™ language compatible. It includes its own Smalltalk source code. You can extend it in Smalltalk and assembly language.

Methods operates on IBM PCs with 512K bytes RAM using MS-DOS or PC-DOS. Color and monochrome monitors are supported. No mouse is required. A Smalltalk language manual and an environment guide are included.

Available from Digital for \$250. Outside U.S. add \$15.00 for shipping and handling. California residents add 6% sales tax. Visa and MasterCard accepted. Educational and Dealer Discounts Available.

plus72. After installing the drive hardware, you need to install firmware—ROM chips—so that your system does not reject the transplant. You must remove all the ROMs in your system, which may total two or four, and replace them with Core-supplied chips. The chips you remove contain IBM's cassette BASIC program as well as the BIOS, and this copyrighted code is faithfully duplicated in the Core chips, each of which bears an IBM copyright message in addition to Core's. To my knowledge, IBM has never permitted any other company to duplicate the valuable programming code held inside its ROM chips.

When I called Core and asked about this strange companionship, the technician to whom I spoke would not comment on the relationship between IBM and his company, saying only that IBM was a Core customer and that he therefore could not imagine why the computer giant might be upset about Core's distributing its code.

Unlike IBM, which supplies a special tool with the ROM upgrade kit it sells for the earliest PCs, Core does not supply a chip removal tool with its ROMs. This omission makes removal immensely more difficult. I discovered, however, that a blank slot cover from the back of the AT makes an excellent tool to pry out the chips. Work slowly and gently pry up first one end, then the other, of each chip, lifting it only a fraction of the way at a time.

Installing the chips proved trickier than I had at first anticipated. Being—in theory at least—an old pro at this sort of thing, I knew that ROM chips were delicate creatures that could not tolerate large stabs of static electricity or other mishandling. Consequently I used the utmost care in removing the stock IBM ROMs and replacing them.

My experience in chip matters proved to be my undoing, however. Anyone who has dabbled at integrated circuitry knows that chip sockets are marked to indicate the direction that the chips inserted into them are supposed to face, and I followed these socket markings as I installed the Core chips. When I turned the AT on afterwards, the ROMs acted much like flash-bulbs, giving off minute and momentary flashes from the tiny windows underneath their labels. The lack of all other life in the

PC power ... anywhere.

REMOTE lets you use all of your PC software from the other end of a telephone line ... wherever that might be!

All you need is a terminal or portable microcomputer, a modem, and a phone line. You can call into the host microcomputer, access it, and run most popular programs, including word processors, spreadsheets, and database managers. You'll see the program in operation just as if you were sitting in front of the host computer.

REMOTE's powerful electronic mail system rivals those found on mainframes, with full password protection. Why leave your PC power in the office ... when you can give it a call with **REMOTE™**

ATplus HARD DISKS

AT confirmed that I had made a very grievous error.

Reconstructing the crime, I discovered that IBM had installed half the ROM chip sockets in this particular AT backwards. Of course, IBM's assembly machines, unable to read socket markings, installed the chips correctly anyway. When I had properly installed a second chip set, the AT sprang to life. However, because I had already set up the system for a type 2 hard disk and another variety was now resident, the AT was at best lackadaisical about booting. In fact, it took several minutes for it to even admit that it had a disk error. Running the setup utility again and indicating the proper drive type—number 9—made booting up quick and painless. (Those who follow Peter Norton's column should know that a type 9 drive usually runs to 112 megabytes—and the Core totals only 72. Here, apparently, is one of Core's modifications to the IBM BIOS.)

Setup does not end the software installation procedure, however. Next you must run through the standard IBM hard disk installation with the FDISK and FORMAT utilities. Using the /S option with FORMAT allows your AT to boot from the plus72.

Following the Core instructions gives you only one option in partitioning the plus72: to set up the Core disk as a single 32-megabyte DOS partition. Accessing the missing megabytes of the big Core disk requires that you install a device driver in your CONFIG.SYS file to make DOS think that you have added a second disk, drive D:, to your system.

Once DOS realizes that there's more to your Core disk than meets the eye, you must set up its partition structure with a Core-supplied program called ATDISK, then format the partition with another program called ATFORMAT. When that is completed, your Core plus72 operates as if it were two separate 32-megabyte hard disks, drives C: and D:.

Premium Performance

Once you have an ATplus disk up and running, you'll see that the extra dollars you spent will reward you with top performance. Cheap hard disks (20-megabyte add-on hard disk drives can cost as little as \$600 or \$700) can't make the grade that

IBM has set for the AT: that 40 millisecond average access time. It takes a pretty special drive to scamper through your data at that rate.

Core is so proud of its drives that is has bequeathed to the world a program called *DISKp* for checking out drives (available to readers through *PC Magazine's* Interactive Reader Service). As you would expect, both Core drives passed the test with flying colors.

Before I tested the ATplus drives, I first put a normal AT CMI fixed disk through its paces as a control. On the Core random test, it scored an average access time of 37.56 milliseconds, comfortably within IBM's specifications. The Core plus20 virtually duplicated CMI's results, turning in an average access time of 37.89 milliseconds. The Core plus72 was the speed demon of the group, racing through the same test in 25.48 milliseconds, more than 30 percent faster than either its sibling or the CMI.

The *PC Magazine* BASIC read/write tests were startling only because the results showed so little difference. In using records 512 bytes long, the scores for the three drives in the random writing, random reading, and sequential reading tests in seconds were, respectively, CMI: 6.15, 7.09, 4.06; plus20: 6.60, 8.29, 4.17; plus72: 6.48, 6.04, 4.12. Obviously, any of the threesome is so fast that the overhead inherent in compiled BASIC is the ultimate speed-determining factor.

Throughout my testing and trials, both ATplus drives performed smoothly, elegantly, and quietly—without the clangs, rings, burps, and belches I've heard from other voice-coil-based drives. I could hardly hear them purr above the whir of the AT's fan.

Like the standard-issue CMI drive, the ATplus units swing into action instantly and unobtrusively when you call on them. Once you screw the lid back on your AT, they will, in fact, be invisible to you. The sturdiness of their construction means that you can probably put them out of mind as easily as out of sight. You shouldn't have to worry about either one for a long, long time.

Winn L. Rosch is a contributing editor for *PC Magazine*.

PROGRAMMING • STEVEN HOLZNER

How to Realize Cache Savings

By putting part of your PC's memory in a disk cache, you'll use a mainframe technique to save time wasted by unnecessary disk accesses.

If there is one thing practically every PC owner wants, it's a big, fat RAM-disk. It's only too painfully obvious that mechanical disk drives—particularly floppies—drastically slow you up every time they're accessed. Electronic disks, on the other hand, run at main memory speed, since a RAMdisk is simply a dedicated part of the main memory itself.

Unfortunately, however, many PCs have only 256K (or less) of random access memory. By the time you load DOS, BIOS, COMMAND.COM, and your application program, this may leave only enough room for a small sliver of a RAM-disk. In such cases, the disk cache described in this column represents a better use of your memory resources.

Caching

The concept of disk caching is simple. Every time the PC reads a file, the disk head must move to the appropriate track, engage it, and read off sector after sector from it. Then the head must move to the next requisite track and repeat the process until the entire file has been read. As the data is acquired from the disk, the disk controller uses direct memory access (DMA) to store it directly in memory where the program can use it.

It is at this point that a well-designed disk cache system will step in, read the data that is now in memory, and store it in itself as well. That way, the next time the same data is called for, the disk cache system can step in again, divert control away from the disk controller, and simply transfer the data from its own internal reservoir. Thus, the data can be delivered to the calling pro-

1985/No. 16

gram in a fraction of the time it would take the disk controller to get it reread. The cache operates like an on-line RAMdisk that has no drive letter designation.

A proper disk cache must also know when the diskette is changed, so it wouldn't naively step in and supply the data it has stored from sectors of a previously used diskette. Similarly, it must know when the sectors it is storing are written over. And, as data is written out to a diskette, a really good cache system will store it en route, thus saving time if that data is to be called for again. Such a system is called a write-through cache.

Unlike the IBM BUFFERS facility, our disk cache has all these capabilities. (Among other differences, BUFFERS does not create a write-through cache. Also, the buffers are flushed, requiring a fresh disk read, if a program ends but is

then called up again). You can set the size of your cache anywhere from 12K to 62K, and its operation is invisible.

Your Own Copy

The easiest way to acquire a copy of CACHE.COM and its associated .BAS and .ASM files is to use your modem and download directly from PC's Interactive Reader Service at (212) 696-0360. Alternatively, you can type in the BASIC listing shown in Figure 1. When you run this (under DOS 2.0 or 2.10), the program will ask you for a cache size between 12K to 62K. At least 32K is recommended; use 6K per disk drive as a minimum. When the BASIC program finishes and you revert to

SYSTEM, you'll find that CACHE.COM has been created for you. Simply typing CACHE will now attach the program to DOS.

Readers who prefer to work in assembly language can get a listing of the commented source code either via the modem number shown above or by sending a self-addressed, stamped envelope to Technical Editor, *PC Magazine*, One Park Ave., New York, NY 10016. In the assembler version you set the size of the cache simply by changing the value of the variable identified as TBL_LEN, originally 64, to the number of sectors you want to cache. (Typical of assembly language variables, TBL_LEN is long enough to be distinct

and yet too terse to pronounce.)

Diskettes formatted under DOS 2.0 or 2.10 have two sides and 40 tracks, with 9 sectors in every track. This means you have a total of 720 512-byte sectors, a healthy amount of data. If the Cache program tried to store everything read in from the diskette, it would be quickly overwhelmed under the weight of assemblers, editors, BASICA, and so on. To prevent this, Cache stores sectors only if they are read in singly. Since most application programs, such as BASICA, MASM, Link, or Exec2Bin load as a called group of sectors, this strategy maximizes time saved without requiring the creation of a king-sized disk cache.

```

Figure 1: The BASIC program that will automatically create CACHE.COM.

By far the slowest way to read data from a disk is to call for it sector by sector. This is because the disk head must be repositioned for each read. Once the head has been positioned, it is almost as quick to scoop up nine sectors from the track as one. Thus, by filling itself with the contents of sectors most frequently read singly, Cache smooths the whole process out.

Even DOS itself uses sector-by-sector reads for the diskette directory and for its own internal disk data, the File Allocation Table (which has the engaging acronym FAT). Since these are continually accessed (if you want to read any file from the disk, you first have to find it in the directory and FAT), Cache keeps them per-

manently in its memory. For the rest, however, Cache stores only the most recently read sectors and writes over the least recently used sectors first.

This type of caching, Least Recently Used Caching, is the most efficient system and is used for disk caches in practically all mainframe computers. Indeed, in such big machines, memory itself is also cached this way. Most main, bulk mainframe memory is relatively cheap and relatively slow. (To give you an idea of the speeds involved, the PC's own memory was designed to use chips with a 200-nanosecond response.) By keeping sections of the most recently accessed memory in a small, fast (about 50-nanosecond access time) cache,

larger computers can increase their working memory access speed, often to 90 percent of the speed of the cache memory alone.

The Particulars

CACHE.COM must intercept the PC's floppy disk controller whenever it is about to read and write to the diskette. Although that may sound esoteric, it isn't actually very difficult, thanks to the PC's interrupt system.

To make a PC out of an Intel 8088 microprocessor, IBM built (or, rather, obtained from MicroSoft) an operating system that "fleshes out" the chip's interrupt provisions with addressable subroutines

(Figure 1 ends)

for communicating with screens, drives, printers, and other external hardware. Whenever an interrupt is executed by the 8088 (by giving it an instruction such as Int 5 (the PrtSc interrupt) in your program), a

search is made for an address in a special table in the lowest part of memory. This address contains the location of the subprogram that actually performs the action and communicates with the hardware—in

this case, printing the screen. This way, IBM has wrapped pages of specialized code into a single, neat command.

The interrupt used to communicate with the disk drives is Int 19. Depending on how you have set the 8088's internal registers, you can read sectors from the disk, write them from memory, format a track, or perform a variety of other functions. Our nimble Cache program, therefore, slips in and simply replaces the original Int 19 address with its own address. Thus, whenever DOS performs an Int 19, it gets diverted to Cache.

When a program wants to read a specific area on the disk, the Cache program can act like a filter. If that sector has already been stored in memory, all Cache has to do is to transfer it from storage to where it's required. If that sector hasn't yet been stored, Cache can read it and store it by using Int 19.

When a program wants to read a specific area on the disk, the Cache program can act like a filter.

Changing Disks

So far I've only discussed what happens when working with a single diskette. In the course of using the PC, however, you often change diskettes, and unless Cache can detect the changes, it might end up supplying old sector data from the first disk to new applications.

To prevent this, Cache uses the same test DOS does. Whenever DOS is asked to read a file from disk, its first operation is to read in Track 0, sector 2 (the first sector of the File Allocation Table) or Track 0, sector 6 (the beginning of the directory). Sector 2 is commonly read in first, since it contains the disk identification byte, telling DOS what format to expect. The directory is then read in to tell DOS where to find the file it wants.

Since they must be consulted so frequently, Cache always keeps the File Allocation Table and the directory in the memory. Whenever sector 2 or 6 is read, Cache compares all 512 bytes to what it already

"Volkswriter® Deluxe..." the critics' choice!

“Thirty word processing programs were reviewed ... no other program received a higher overall evaluation than Volkswriter Deluxe.”

Software Digest Ratings Newsletter, January 1984

“If WordStar™ set a standard ...

Volkswriter Deluxe sets a new standard

for transparency, simplicity, and speed. You can learn Volkswriter in under an hour ... because it does so many things exactly the way you think they should be done.”

“VOLKSWRITER DELUXE is the best buy in the IBM-PC™ writing tool arena.”

has. If they don't match, Cache resets ("flushes") all the sectors it has previously stored from that drive.

This means that even after whatever you're doing is securely in Cache, there must still be a short disk read at the beginning of an operation. It's intriguing, though, to see the drive turn off in the middle of a long directory listing, for example. (DOS also checks the FAT at the end to tell you how many bytes are free on the disk, so the drive will still turn on again briefly.)

Even after whatever you're doing is securely in Cache, there must still be a short disk read at the beginning of an operation.

How Fast Is It?

The speed you will gain, inevitably, depends on what you're doing. As far as straight reading from the disk alone is concerned, I've tested Cache with a program that first reads a sector on one track, then reads a sector from a different track and repeats the whole process 50 times. Before caching, the program took a full 25 seconds to run; after caching, it took about 1.

On the other hand, even though programs usually will read in data sector by sector, they are also usually engaged in some processing. Thus, even though the data comes in faster, the overall time isn't overpoweringly improved. For example, as BASIC reads in a program it tokenizes it, converting it into the tokens it can recognize, and this process takes some time. Still, even loading longer BASIC programs will be sped up by about 20 percent.

The process of assembling and linking also depends on the size of the program. For large programs, assembling, not disk reading, takes the most time so the overall process may again be shortened only by about 20 percent. For small programs, however, the process is limited by disk speeds, and so Cache can increase the speed by 45 percent (not much more than that, however, because the disk must be written to and not just read).

At any rate, however, you'll find Cache is a neat little package that will soon save far more than the time it takes to get it up and going and will additionally reward you with the satisfaction of knowing that

you're using your PC's memory as efficiently as possible.

Spreadsheet Clinic

This forum offers our readers an opportunity to exchange the quick fixes, simple solutions, and fancy footwork they've developed to make their spreadsheets work better.

Shrinking a Spreadsheet for Maximum Memory

If you use large 1-2-3 models, your computer may run out of memory. An obvious way to get memory back is to get rid of unnecessary cells. If you decide you don't need cells beyond a certain point in the worksheet, go to the cell just below the last useful cell and hit /Range Erase (End) (Home) Enter. This will erase everything between the last useful cell and the last cell in the worksheet.

However, you won't get all your memory back just because you erased the cells. If you hit (End) (Home) again, you will find that the cursor ends up at the cell that was last in the spreadsheet before you used /Range Erase. In other words, 1-2-3 thinks the spreadsheet is still the same size as before, even though the cells are blank. It will release the memory it was using to store the cell contents but will still require some memory just to keep track of the blank cells it thinks are still part of the worksheet.

To get all your memory back, do a /File Save and then a /File Retrieve. By reading the worksheet back into memory, 1-2-3 figures out that the blank cells really aren't part of the spreadsheet and thus releases the memory it was using to keep track of them.

There are times, though, when even this technique won't work. Even after the /File Save—/File Retrieve sequence, the (End) (Home) command still may take you to a blank cell (the last one before your /Range Erase) at the bottom of the worksheet. The reason is that some of the now-blank cells were either unprotected or for-

matted with the /Range Format command. In either case, 1-2-3 treats them as if they held data, refusing to give them up, and so wastes memory on them.

You can solve this problem by using /Range Protect (End) (Home) and /Range Format Reset (End) (Home). These operations disable the special status of these cells and allow 1-2-3 to ignore them. Now, after you have saved and retrieved the worksheet, you will find that you have gotten all your memory back.

Tom Spross
Cedar Crest, New Mexico

1-2-3 is notoriously poor at managing memory, so it's a good thing RAM chips have become so cheap. Release 2.0, which is due this fall, will use memory more efficiently. In the meantime, tips like this one are a big help.

Printer Setup Files

We have a smorgasbord of different printers connected to our PCs and have had trouble keeping track of the different printer setup codes needed to control each one. I got tired of drawing up code sheets, and so I worked out a system of printer setup worksheets instead. These files contain no data—only a printer setup string. I merge a worksheet into a file when I am ready to print.

For example, the control code to make the DEC LA100 printer run at 12 pitch is Esc[2w. To set up a 1-2-3 printer setup file, you clear the worksheet, give the /Print Printer Options Setup command, and enter the string 027/091/050/119. Then save the spreadsheet using as de-

scriptive a name as possible, say, LA10012P.WKS.

Now, whenever I have a spreadsheet to print on the LA100 in 12 pitch, I first do a /File Retrieve of LA10012P. Then I do a /File Combine Copy Entire of the spreadsheet I want to print. This puts the right set-up string in my spreadsheet without my having to fumble with the printer codes.

Jeffrey Katz
New Bedford, Massachusetts

This procedure works fine. Another way to do the same thing would be to build a worksheet that contained only the macros necessary to display and execute a menu of different printer setup options. You might, for example, have a file with a menu for the various setup options for the DEC LA100. You could then retrieve that file, choose the right option, and let the macro write the setup string. Then, since the next operation will be a /File Combine, the macro would erase all the cells in the setup worksheet. You could then combine the file you want to print and get the same results as described above.

This method has the advantage of requiring only one printer setup file per printer. Mr. Katz's method requires a file for every single printer option, though it's foolproof and much simpler to implement.

Making a Table of 1-2-3 Range Addresses

Symphony has a Range Name Table command that lists the cells represented by range names. 1-2-3 does not have this feature, but a short macro I have written (Figure 1) will produce the same table that

E	F	G
\T	/c{right}- /rncCC{bs}{right}- /xi@count(cc)=0/xgSORT- {right}{edit} {home}{del}@sum{end}}- {edit}{bs}{home} {del}{del}{del}{del}{del}}- {left}{down} /xgT- SORT: {up}{end}{up} /dsr d{bs}{end}{down}{right}- p-a-g	'Copy this label name to right 'Name these 2 cells as Current Cells (CC) 'If blank, go to SORT step 'Edit duplicate label name 'Convert to @sum(x) formula 'Edit again 'Convert formula back to label 'Go to next label name in list 'Loop back to process next address label 'Position cursor for sort 'Reset sort parameters 'Define data range 'Define sort key . . . go

Figure 1: A macro that will create a table of range names—and sort them.

Symphony does and will sort the list of range names alphabetically.

To use the macro, first make a list of range names in a column in your worksheet, as in the "before" part of Figure 2. Make sure that there is an empty cell above and below the list and that there are no empty cells within the list. When you are writing the macro, remember to give the range name SORT to the cell where the sort routine begins. To fill in the table with the cells in each range, put the cursor on the first range name of the list and run the macro. (I call the macro \T for table.)

This macro is a big help in keeping track of ranges in complex worksheets. Whenever I create a new range, I add it to the list of names and rerun the macro. This keeps the documentation current and accurate.

Michael Krietemeyer
Akron, Ohio

This is a very clever macro, especially the procedure in lines 4 through 7 that produces the coordinates of the beginning and ending cells of each range. Nice tip.

Hiding Notes Within a Worksheet

When I build *I-2-3* or *Symphony* models to be used by other people, I make a point of annotating them. I describe all assumptions and, when appropriate, the rationale behind an assumption. However, if the annotations are in the worksheet itself, the result can be visually confusing, and if they are on paper, it may be awkward for the

user to refer to them while he is running the model.

Lately, I've discovered a way to "hide" annotations within a worksheet. The trick is to create a new column, only one character wide, to the left of the values you want to annotate. If, when you type notes into that column, you begin with a space or two, the column will normally appear to be empty. When the user needs to read your notes, however, he can move the cursor to that column, and a line of text will appear in the control panel. If he wants to read all the text at once, he can temporarily widen the notes column.

John Schlosser
Seattle, Washington

This is the best way I know to annotate a spreadsheet, though you may need to watch out for a few things. For example, when you're typing in a notation on the

second line of the control panel, you can use up to 80 characters. But once that note is entered, and a user wants to read the contents by putting the cursor on that cell, the note will appear in the top line of the control panel, which displays only 67 characters. Hitting the F2 key will bring back all 80 characters, but not all spreadsheet users will think of that.

Another point to remember is that a long annotation will show up in any blank cells to the right, even if the adjacent cell to the right has something in it. Let's say column A contains your notes, columns B and C contain values, and column D is blank for aesthetic reasons. Your note text won't appear in B or C but, if it's long enough, it will peep through in D, which is blank.

A New Set of Keys

In your column you have outlined several shortcuts for entering numeric data into a

===== BEFORE =====	===== AFTER =====
RANGE NAME LIST =====	RANGE NAME LIST =====
SUM	A
A	B
C	C
B	SUM
	A2..A16
	C2..G2
	D5..F13
	C16

Figure 2: A printout of a list of range names in a spreadsheet before running the macro in Figure 1 and after, including a display of the cell locations.

Lotus spreadsheet (see *PC*, Volume 4 Number 7). I have found that the best way to use the numeric keypad for entering a column of numbers is to use a program like *ProKey* or *Smartkey* to redefine the Enter key as the down-arrow key. That way, you hit NumLock to activate the numeric keypad, and then hit Enter after every number. You won't need to hold down the shift key to move the cursor or fool with macros. And if you need to put numeric data in rows, you can always redefine Enter as the right-arrow key.

Benny Mah
New York, New York

That works just fine. However, I would be leery of deactivating the Enter key, even if only temporarily. Why not redefine the PrtSc key as the down-arrow key instead? PrtSc doesn't do much for you in 1-2-3, anyway, and this alternative would preserve a key I'd like to keep.

The Last Word on NumLock

In your column you have already written about shifting back and forth between numeric entry and cursor movement by holding down the shift key (*PC*, Volume 4 Number 7). For those of us who can't walk and chew gum at the same time, I have written a macro that allows single-handed data entry using the numeric keypad:

```
^A {?}{down}/xg^A"
```

To use it, hit NumLock and then run the macro with Alt-A. You can now use the numeric keypad to enter numbers. Every time you hit the Enter key, the number will appear in the cell, and the cursor will move to the cell below.

If you make a mistake or want to move to a different part of the spreadsheet, hit NumLock and use the cursor control keys to move into position. The macro will still be waiting for your number and will move to the next cell as soon as you hit Enter.

If you work with rows of numbers, you can set up another macro just as easily that moves you to the right every time you hit the Enter key.

Bill Taylor
Lakewood, Colorado

This endless-loop macro is about the slickest solution to the problem I think we are going to see. I'll be happy to be proven wrong, but I think we can now lay this issue to rest.

EDITED BY CHARLES PETZOLD

Power User

This column is where readers share their hardware and applications software discoveries. This installment focuses on Turbo Pascal.

In every issue of PC Magazine, Power User presents a variety of tips for software and hardware applications, concentrating on those products that help businesspeople increase their productivity. This installment focuses on a very special product: Turbo Pascal, Borland's revolutionary implementation of Niklaus Wirth's structured programming language. Everyone from the dedicated hacker to serious managers and professionals is using Turbo Pascal to create utilities, file handlers, sort procedures, and the like to make their jobs easier and their time more productive.

While many businesspeople may think of Turbo solely as a tool for programmers, those who give it a chance are finding the clear logic and simple structure of this compiler to be a source of new power for their PCs. The following tips should add to that arsenal.

Quick Turbo Entry

I've been using Turbo Pascal recently and decided to make a modification to the compiler so I wouldn't have to answer the opening message that asks "Include error messages (Y/N)?" Answering No to the prompt only saves about 1.5K of memory. It's just not worth the trouble, especially when I take advantage of the type-ahead buffer and find that all of what I typed is lost. The modification will cause the error messages to be included every time Turbo is used.

Tracy Brewer
Charleston, South Carolina

You're right—that opening message in Turbo Pascal is a true annoyance. Answering No may save memory, but it also means you have to look up error messages

in the manual. We've changed your patch somewhat so it won't interfere with other Y/N questions the compiler asks. Figure 1 shows the patch for both Turbo Pascal Versions 2.0 and 3.0. You'll need the PC-DOS 2.0 or higher version of DEBUG to make the change. As usual, work with a copy of TURBO.COM when patching with DEBUG.

Changing Editor Colors

If you use Turbo Pascal with a color monitor, you might like to change the default colors that the editor uses. I find the bright yellow characters on a black background to be very harsh. Turbo Pascal Version 2.0 keeps video colors in offset addresses 016Eh through 0170h of the TURBO.COM file.

The low-order nibbles (low four bits) in addresses 016Eh and 016Fh are the foreground text colors for the NORMVIDEO and LOWVIDEO modes, respectively. The high-order nibble is always F. The background color is stored in the high-order nibble of address 0170h, with the low-order nibble always F. These 3 bytes are normally FEh, F7h, and 0Fh. The color codes in these nibbles can be found listed on page 18 of the Addendum of the Turbo Pascal Version 2.0 manual, except that high-intensity background colors are not available and, if used, will cause blinking instead.

LOWVIDEO to brown, use DEBUG to make the following patch in Turbo Pascal Version 2.0:

```
A>DEBUG TURBO.COM
-e 16E F2 F6 0F
-w
-q
```

In addition to changing the colors used by Turbo Pascal in interactive mode, this patch will also change the colors in programs compiled under your new version of Turbo. To change to something different within a program, the TEXTCOLOR and TEXTBACKGROUND procedures still work as usual.

William E. Allen
Redford, Michigan

Many people seem to like a blue background with bright yellow characters for normal text and low intensity white for highlighting. In Turbo Pascal Version 2.0, this can be accomplished by patching FEh, F7h and 1Fh in the three locations starting at 016Eh.

Turbo Pascal Version 3.0 handles color a little differently. The real BIOS attributes (background in high nibble, foreground in low) are kept in addresses 0177h and 0178h. The DEBUG patch is

```
-e 0177 1E 17
```

for yellow and low-intensity white on a blue background.

Disabling the Clear Screen

The review of Turbo Pascal in the November 13, 1984 issue of *PC Magazine* (Volume 3 Number 22) complained about the screen clear that Turbo Pascal always calls at the beginning of program execution. I've found a way to disable it. After this patch has been made, if you want the screen to be cleared in a program, you must use the procedure CLRSCR.

David Issel
Sacramento, California

Borland International apparently listens to complaints. Version 3.0 of Turbo Pascal does not clear the screen when a program begins. Those of you who still have Version 2.0 can use the procedure shown in Figure 2 to disable this initial clear screen.

Changing the Cursor

I developed a method of changing the cursor size within Turbo Pascal that I'd like to share with your readers. This procedure uses the powerful facility of Turbo to call system interrupts without resorting to assembly language.

Turbo Pascal Version 2.0

```
A>DEBUG TURBO.COM
-A 29ED
XXXX:29ED MOV BYTE PTR [023D],0B
XXXX:29F2 NOP
XXXX:29F3 NOP
XXXX:29F4 NOP
XXXX:29F5 <ENTER>
-W
-Q
```

Turbo Pascal Version 3.0

```
A>DEBUG TURBO.COM
-A 2EB7
XXXX:2EB7 MOV BYTE PTR [0348],0B
XXXX:2EB8 NOP
XXXX:2EBD NOP
XXXX:2EBE NOP
XXXX:2EBF <ENTER>
-W
-Q
```

Figure 1. Patches to Turbo Pascal Versions 2.0 and 3.0 to skip past the opening prompt and always include error messages for Pascal compilations.

```
A>DEBUG TURBO.COM
-e 02FC 98 98
-W
-Q
```

Figure 2. A patch to disable the Turbo Pascal Version 2.0 screen clearing at the beginning of program execution. The 2 bytes found at the address 02FCh are normally CDh 16h—a BIOS video call. Users of Turbo Pascal Version 3.0 don't have this problem.

```
program Demo;
var highbar,lowbar : byte; (* used to test procedure call. *)
procedure setcursor(TopLine,BotLine : byte);
type
  BiosParamType = record
    ex,bx,cx,dx,bp,si,di,ds,es,flegs : integer;
  end;
var
  BiosParam : BiosParamType;
begin
  with BiosParam do begin
    ex := 1 shl 8 + 0; (* load AH with request to set cursor line *)
    cx := TopLine shl 8 + BotLine; (* CX with top and bottom line *)
  end;
  intr($10,BiosParam); (* call BIOS Video Service to set cursor line *)
end;
begin (* = main program *)
  write ('Enter highbar of cursor box: ');
  readln (highbar);
  write ('Enter lowbar of cursor box: ');
  readln (lowbar);
  writeln;
  setcursor (highbar,lowbar);
end.
```

Figure 3. A program demonstrating the SETCURSOR procedure to change the size of the cursor. A normal cursor on a color/graphics display has a "highbar" of 6 and a "lowbar" of 7.

The cursor is a series of horizontal lines numbered from top (line 0) to bottom (line 7) on color displays; line 13 on monochrome). By calling this procedure with various values of TopLine and BotLine, the cursor can be set to a line, a box, or something in between. Invalid values may cause the cursor to disappear.

The procedure is shown in a program that illustrates the effect it has on the cursor size.

Steve Hall
Beaverton, Oregon

A Turbo Pascal programmer equipped with the PC Technical Reference and the DOS Technical Reference manuals can do most anything an assembly language programmer can. Figure 3 demonstrates the SETCURSOR procedure in action. This is a good example of getting the interrupts to go beyond the already extensive facilities included in Turbo Pascal.

WordStar-to-ASCII-via-Turbo
I've recently had to convert WordStar files

```

{$G16384,P16384,D-}                                {Compiler directives for redirection}

program WS2ASCII ;

var
  Ch   : Char ;                                     {Character to be read and written}

begin
  While Not Eof Do Begin
    Read(Ch) ;                                       {Get the character}
    Ch := Char(Ord(Ch) And 127) ;                   {Strip out the high bit}
    If Ch = '-' Then Ch := ' ' ;                   {Convert soft hyphens to hard}
    If (Ch >= ' ') Or (Ch = '^I') Or (Ch = '^J') Or (Ch = '^M') Then Write(Ch) ; {Write characters, tabs, CR, LFs}
    Write ('^Z') ;                                  {Finally, a final End-of-File}
  end.

```

Figure 4. A simple and elegant WordStar-to-ASCII conversion program in Turbo Pascal. Since the program uses redirection of standard input and output, it requires Turbo Pascal Version 3.0 and PC-DOS Version 2.0 or above.

PROJECT MANAGEMENT CONTROL

PMS-II® MEANS BUSINESS

For the serious user who wants to maximize productivity, PMS-II is the project management answer — a complete critical path network analyzer and scheduling package that can be expanded with resource and materials management — and near plotter quality graphics.

- Menu driven — easy new documentation
- Many mainframe features
- Unrestricted project size
- Extensive reporting capabilities

- Runs on most micros with: PC-DOS, MS-DOS, CPM-86

Project management technology is our only business. Send for our newsletter and free literature.

PMS-II retails for \$1295; demo diskette for \$50; introductory diskette for only \$10.

to pure ASCII files. Since WordStar sets the high bit of some characters for internal formatting, this bit must be stripped out. I also wanted to convert "soft hyphens" (stored as 1Fh) to hard hyphens, and also remove all print-formatting codes. The enclosed Turbo Pascal program does this.

Floyd Elliot
Chicago, Illinois

There are plenty of WordStar-to-ASCII unformatters around, but it's always a good exercise to roll your own. The type of program shown in Figure 4 practically cries out for a PC-DOS 2.0 and above "pipe" or "filter" approach. A piping program reads in one input file, does something with it, and then puts the results in a file. Such programs are simplified greatly by using DOS's redirection of standard input and output. We can write the program as if we are reading from the keyboard and

writing to the display and let DOS take care of all the messy disk-file stuff.

While Turbo Pascal Version 2.0 did not support redirection of standard input and output, Version 3.0 does. That's reason enough to upgrade. Figure 4 shows how to use redirection for a WordStar-to-ASCII conversion program. I'm sure you won't mind that we've reduced your two-page program to just 13 lines and made it four times as fast.

Note, however, that all "soft hyphens" will be converted to hard hyphens, so you might want to remove soft hyphens that occur in the middle of lines before running the conversion.

To run the program, type the command line

WS2ASCII<inputfile>outputfile

where "inputfile" is from WordStar and "outputfile" will be in ASCII. Don't use

the same file name for both. If you leave off the ">outputfile" from the command line, the resultant ASCII file will be displayed on-screen, a quick way to read WordStar files from DOS. If you forget the < character before the input file name, the program will just sit there, waiting for keyboard input. Just type a Ctrl-Z and Enter and try again.

Easy Subdirectory Switcher

Okay, this sounds simple, but sometimes the simplest tricks are the best. My AT hard disk is snarled by such an intricately nested tree structure that switching back and forth between two deeply buried subdirectories used to be a real exercise in patience. Now I can do it instantly, without having to remember each complex PATH prefix with all of its easily mistyped backslashes and inscrutable abbreviations.

The trick is to put a whole slate of one-line batch files in one of the subdirectories

you PATH to most often. (Incidentally, the program that performs this trick assumes you're not using subdirectory names with periods and extensions; we've found most users don't.) The name of each batch file is the name of the subdirectory itself (with a .BAT extension) without the long, convoluted PATH-and-backslash prefix. Each batch file contains simply the "CD" command with the long, convoluted PATH-and-backslash prefix.

The BATMAKER.BAS program in Figure 1 creates all the necessary batch files

```
100 'BATMAKER.BAS -- by PC Magazine --
110 'This creates easy subdirectory switcher files.
120 'Before you use this, get into DOS and type:
130 '
140 '   chkdsk / v | find "Dir" > tempfile
150 '
160 'Be sure to (1) run this in a subdirectory you
170 '   PATH to often, (2) check to make sure each
180 '   subdirectory has its own unique name, and
190 '   (3) DON'T CHANGE the program's line numbers!
200 'To switch between subdirectories in DOS, type
210 '   in the name of the subdirectory WITHOUT
220 '   the "CD\" prefix, and WITHOUT the long
230 '   PATHname that usually precedes it.
240 ON ERROR GOTO 370
250 OPEN "tempfile" FOR INPUT AS #1
260 IF EOF(1) THEN 360 ELSE LINE INPUT #1, A$
270 A$=RIGHT$(A$,LEN(A$)-12):IF A$="" THEN 260
280 FOR A=LEN(A$) TO 1 STEP -1
290 IF MID$(A$,A,1)<>"\" THEN 310
300 NM$=RIGHT$(A$,LEN(A$)-A)+".BAT":GOTO 320
310 NEXT
320 PRINT "Creating "NM$; " batch file..."
330 OPEN NM$ FOR OUTPUT AS #2
340 PRINT #2,"CD\"A$;:CLOSE #2
350 GOTO 260
360 CLOSE:KILL "tempfile":PRINT:LIST 200-230:END
370 IF ERR=53 THEN LIST 120-140 ELSE ON ERROR GOTO 0
380 CLOSE:END
```

Figure 1: BATMAKER.BAS program that creates individual batch files used for switching easily between subdirectories. Be sure to get into DOS before running this and execute the command in line 140 beginning with chkdsk /v. And be sure to run this in a subdirectory you PATH to often.

USER-TO-USER

for you automatically. Before you run it, get into DOS and type:

```
chkdsk /v | find "Dir" > tempfile
```

If you try this, be careful that you don't have two subdirectories like \TAX1984\JAN and \TAX1985\JAN, since BAT-MAKER ignores everything before the final backslash and would try to create two files called JAN.BAT. Also, be careful with subdirectories that have the same name as an executable (.COM or .EXE) file, since DOS gives .BAT files a lower priority and may run a program when all you want to do is change directories. If this happens, rename the batch file—from W5.BAT to W.BAT for instance.

Again, make sure you put all these newly minted .BAT files in a subdirectory you PATH to. When you're all done, to switch back and forth between \NOTES\ROUGH\CHAP1\FIGS and \DOS\BASICS\COMPILER\UTILS\WRK, all you have to do is type in FIGS or WRK. Finally, if you do use subdirectories, be sure to include a line in your main AUTOEXEC batch file that changes the PROMPT to reflect the logged subdirectory. Users who discover this for the first time invariably end up throwing in the date, the time, funny messages, and odd spacings instead of the garden variety A>. but I much prefer the more efficient PROMPT \$p: or PROMPT \$p\$g instead.

BASIC Screen Dumper

The PRNTRSCRN.BAS program in Figure 2 contains a subroutine you can use when you want to print out the contents of the screen from within a BASIC program. To print characters, simply CALL the subroutine; to print graphics, however, you have to run the DOS GRAPHICS.COM utility first. Make sure your printer is on line before you execute this.

Jim Anes
Ontario, Canada

This routine can come in handy, but if you do use it, include traps for errors 24, 25, 27, etc.

Subdirectory RENAMEr

The DOS 2.0 RENAME command cannot change the name of a subdirectory. To do it manually, you have to create a new subdirectory, copy your files to this new subdirectory from your old subdirectory, delete the files in the old subdirectory, and then delete the old subdirectory name from your disk.

The RENDIR.BAS BASIC program in Figure 3 creates RENDIR.COM, which can rename a subdirectory automatically. To use it, enter the command:

```
RENDIR [drive:]OLDSUB NEWSUB
```

where OLDSUB is the name of the old subdirectory and NEWSUB is the name of the new subdirectory. The drive name is optional and can be used to rename a subdirectory on a disk drive other than the default one. The old subdirectory name must exist in the current directory of the drive you specify. You can also use ? or * in the command but note that using these might cause a regular file to be renamed. For example, if you had a file named GFILE and a subdirectory named GSUB and entered the command:

```
RENDIR G* H*
```

the two filenames would become HFILE and HSUB.

Starting with DOS Version 2.0, the DOS interrupt 33 (21 hexadecimal) gives programmers two sets of routines to manipulate files. The first set is the routines that existed in DOS Versions 1.x and were kept for compatibility purposes. The sec-

```
100 ' DELAYER.BAS -- by John P. Tabakelis
110 INPUT "Enter the number of seconds to delay: ",N
120 TIMES="00"
130 SOUND 32767,(N*18.2):SOUND 32767,1
140 PRINT "The delay lasted exactly ";TIMES
```

Figure 4: DELAYER.BAS program to demonstrate precise control of timing delays in both interpretive and compiled BASIC.

ond, newer set of DOS 2.x routines can handle path names. While a subdirectory cannot be manipulated with the new routines, the old ones can access it through the use of an extended file-control block.

Two error messages might be returned by RENDIR: "Parameter error" (which means an old and new directory name were not provided) and "Name not changed" (which tells you that either the old subdirectory name was not found or the new subdirectory name already exists).

Michael F. Roberts
Snohomish, Washington

This short and sweet program does the job. Another trick for renaming subdirectories is to go into BASIC and use the NAME filespec AS filespec command.

Footproof BASIC Delayer

A letter in PC Magazine, Volume 4 Number 12, suggested a way to create a time-delay loop. The BASIC manual mentions a trick using the SOUND statement that solves this problem for all PCs, XT's, AT's,

The BASIC manual mentions a trick using the SOUND statement that solves the problem of creating a time-delay loop for PCs, XT's, and AT's in both interpretive and compiled versions.

and compatibles in both interpretive and compiled versions. Figure 4 contains a small demo program that illustrates how this works. Using the TIMER function would also do the job, except that this can't

```
A>DEBUG COMP.COM
-g 39a nn
-g 809 "xx"
-w
Writing 09E6 bytes
-g
```

Figure 5: Instructions for patching DOS 2.x COMP.COM to change the number of mismatches it will find before stopping. As an example, to change the number to 14, replace the nn with 0E (the hexadecimal notation for 14) and the "xx" to "14". Note: For DOS 3.x substitute 879 for 39a and b51 for 809.

be handled by the BASIC 1.1 compiler, which is long, long overdue for some updates.

John P. Tabakelis
Malvern, Pennsylvania

The only drawback to this is that it produces a small speaker click. However, it does work on every PC configuration we tried. And we agree it's a real scandal that IBM hasn't released an updated BASIC compiler.

Beyond DOS COMPare

The DOS compare files command (COMP) compares two files until it finds 10 differences, then stops. However, you may occasionally want to continue comparing two files even though the number of differences exceeds this limit.

You can use DEBUG to change the limit from 10 to any number of comparisons you'd like, by following the instructions in Figure 5. Type in everything underlined, replacing nn with the hexadecimal equivalent of n, (n being the new limit) and "xx" with the actual characters for n (in quotes). A similar patch (see Figure 6)

Ever wish you could access data 200,000 times faster on your IBM Personal Computer?

Or IBM
compatible
systems

**Now it's possible...with the new solid state
MegaRam-PC Disk Emulator.
(Worst case access time: 1.2 microseconds.)**

The MegaRam-PC boosts your IBM disk drive accesses by more than 200,000 times. Provides dramatically increased performance. Compared to a floppy disk, the MegaRam-PC reduces access time by 267,000. Or, compared to a hard disk, it's reduced by 75,000 times.

**Not only that, the MegaRam-PC
increases data transfer rates by 30 times.
(0.95 megabytes/second.)**

The ideal solution for any disk intensive application: networking, graphics, process control, etc.

**Just plug in the MegaRam and watch
your wishes come true.**

With capacities from 2.0 to 16.0 megabytes, the MegaRam-PC is supplied with an I/O driver which installs into your IBM operating system. It responds like another disk drive and is compatible with existing software. A battery back-up option is available to protect stored data if input power is removed. A comprehensive error detection and correction option is also available.

PC Tutor

Do you have a technical question about your PC? PC Tutor answers both elementary and advanced inquiries.

Finding BASIC's Data Segment

Q: I wrote a BASIC program that uses about 8K of file space when saved. The program contains a 27-byte machine language program and is poked into supposedly reserved space just below the 64K upper boundary of the BASIC workspace. Additionally, a 16K screen display is BLOADED adjacent to the machine language, also below the 64K boundary. I've used a CLEAR statement to reserve 17K of high memory for this purpose.

However, when the display data is loaded, starting at absolute 48128 (segment &HBC0), everything dies.

I tried changing the program to put the machine language program and display data just above the 64K boundary, starting at 65536 (&H1000). The program then works fine for about 50 minutes, after which the data and machine language programs get written over by new data.

I'm using DOS 2.0 on a new PC. Why can't I put my machine language routines just above 64K? And why, for an 8K program with DOS and BASICA loaded, can't I put the routines just below the 64K boundary?

Roy D. Welch
Manchester, Missouri

A: I think you are confusing the space requirements of BASICA with the absolute addresses in your PC. Don't forget, for example, that there are always other programs in memory, such as the operating system, that also take up address space.

Let's suppose (very conservatively) that the operating system takes up 45K in your computer. The BASIC interpreter (another program in memory) takes up another 27K. In such a case, your 64K BASIC program area would actually begin at address 72K (45 + 27) and would continue on through 136K (72 + 64).

What you really need to know, then, is the actual starting address of the BASICA data segment that corresponds to the interpreted program and its storage. The simplest way to find this is with a PEEK instruction, as follows:

```
10 DEF SEG = 0 ' Look at low memory
20 SEGMENT = PEEK(48128) + 256*PEEK(48111)
30 ' now SEGMENT is the segment address
40 ' of BASIC's data area (the program/data)
```

Using Line 25

Q: Using BASIC, how can one place a PRINT statement on line 25, in reverse color (for instance), without having the lines scroll up? I don't find any reference in the BASIC (3.0) manual, but many application programs use this location as a handy place to display status information.

Curtis Rambauer
Don Mills, Ontario

A: You primarily need to ensure:

1. That the PRINT statement for the text on line 25 ends with a semicolon (;) so that the PRINT statement does not scroll; and

2. That following the PRINT statement, you put a LOCATE line, so the next print-out will go to another line.

The following short program gives you a reasonable example:

```
10 KEY OFF ' clear bottom line
20 ' move to alert line, invert video
30 LOCATE 25,1 : COLOR 8,15
40 ' make sure print line ends with ;
50 PRINT "Status Line Message";
60 ' go home for later print statements
70 LOCATE 1,1
```

Old Wine in New Bottles?

Q: IBM has announced that its Enhanced Graphics Adapter (EGA) board is compatible with its older color graphics adapter (CGA) except if the software being used makes sub-BIOS calls to the CGA. I just put an EGA in my AT and have found that many programs do make these calls.

PC TUTOR

Could you help me write a program to redirect the calls now being made to the CGA's memory location over to the memory location of the EGA? It would be very helpful if you could also explain how to make it a core-resident program. That way it can survive a warm boot, so self-booting, copy-protected programs can also take advantage of it.

Finally, is it possible to install memory from 512K to 640K in an AT that has an EGA with 256K of graphics memory? Although IBM has not commented on this in its literature, I have heard that the EGA's memory location is below 640K.

Greg Bitterman
Westbury, New York

A: As a starting point, the EGA's memory begins at 640K, which is easier to understand and visualize as A000 hex. However, like the PCjr, the EGA maps its memory to two different locations. One is A000, and the other is the CGA standard address of B800 (which, if my math is right, is 736K).

Your problem, however, lies not in memory addressing but in port addressing. On the CGA board a Motorola 6845 chip handles the video. Many programs (such as Lotus's 1-2-3) manipulate the 6845 registers directly. The EGA has no such chip. Instead, it uses some VLSI (very large-scale integration) chips that are designed both to emulate a 6845 and to handle the advanced features of the EGA. Unfortunately, however, the 6845 emulation is only partial: programs that expect to work into a 6845 will be sorely disappointed. (Why is it that only IBM can get away with ignoring IBM compatibility?)

As for fixing the problem with a sub-BIOS program, I'm afraid there is no real fix. The only approach is to convince the program writers to use the BIOS initialization calls rather than 6845 register manipulation. The reason many programs bypass the BIOS is that the video calls inside the IBM BIOS are remarkably primitive and rarely do everything one wants done. In desperation, therefore, program writers were forced to bypass the BIOS entirely and work directly with a chip that is now not fully supported. While it is true that the EGA includes newer, updated BIOS video routines of its own, these are

still not as complete as they should be. For example, there is still no easy way to use two monitors simultaneously.

The long and the short of it seems to be, use old programs with the old CGA and hope that sometime someone will get around to writing software for the EGA.

Up a Tree

Q: Since purchasing a hard disk, I am facing some organization problems, and with the introduction of TopView things are getting worse.

My problem is that if I am in one sub-directory and want to call a program in another part of the tree, the PATH option of DOS will allow me to call a .EXE or .BAT program file, but not any associated data or .OVL files needed by the program. For example, my PE.EXE program needs PE.PRO. Both are in the EDIT subdirectory, but PATH will only call the former. Is there an answer?

Philippe Flichy
Boston, Massachusetts

A: I can suggest at least three possible approaches to this vexing problem, which has plagued subdirectory users ever since DOS 2.0 was introduced.

First, there are a number of public-domain software programs that extend the PATH command capability to include all file searches. Thus, as the program searches for overlay files, it will go to the correct subdirectory. I'm not overjoyed about this approach generally, since at least some of these programs (which are available on any number of bulletin boards) may do strange things when you try to create a file.

Second, however, there are more sophisticated commercial programs available (such as EasyPath by Polygon Software Corp) that let you specify certain files that are to be found in specific subdirectories. This tends to make your environment list pretty long, but it does work. (IBM's File Facility, a \$19.95 utility in its Productivity Series, simply and safely extends the scope of PATH searches without requiring you to list the specific files sought. So also does FilePath, produced by SDA Associates.—Ed.)

The third approach is to update your DOS. Version 3.1 contains a program

called *SUBST* that lets you section off a piece of your subdirectory tree as a drive. For example, if you entered

SUBST A: C: \EDIT

this would make the *EDIT* subdirectory accessible as drive A:, and most programs search at least drive A: for required overlays. If your program can handle it, I would suggest using a different drive designator (say E:), since otherwise drive A: will become temporarily inaccessible for other use. In this case, you would just type

SUBST E: C: \EDIT.

Ctrl-PrtSc Toggle

Q: I often write batch files to execute timing programs that do speed tests on various programs. I usually do a Ctrl-PrtSc first so that all of my results are sent to the printer. Can you show me a way to toggle Ctrl-PrtSc, by using BASIC PEEKs and POKEs or a machine language program that can be entered with DEBUG?

Michael Bianco
New York, New York

A: My preference in a case like this is to use a small assembly language routine, since it is much easier to call and takes up so little room—in this case a mere 48 bytes (30 in hex).

You can enter the necessary program by typing in the underlined portions of Figure 1. The figure itself combines the parts to type with a hex dump made after the assembly, so you can compare hex codes if necessary for debugging. The *xxxx* at the beginning of each line is a function of the memory in your computer and so would probably have been different from mine.

One final but important note. This program will only work on IBM PCs and very close compatibles. It assumes IBM's specific placement of the keyboard buffer, and it also assumes the *PrtSc* flag is located 7200 hex (which may differ on other machines).

The PC Tutor solves practical problems and explains points of general interest. To see your questions answered here, drop a line to PC Tutor, PC Magazine, One Park Avenue, New York, NY 10016.

A Graphic Pro For Investors

Many technical investors depend on stock activity charts to examine trends in the market. With Telescan Analyzer, you can retrieve and display these graphs from a 6,500-stock database.

Investors who follow the technical approach to the market depend on stock activity charts as a starting point for conducting their analyses. On a single sheet of paper, they plot data that may reflect many pages of tabulations, hoping to spot some discernable trend—up, down, or sideways.

The type of information displayed in an activity chart includes high-low price range, closing price, time frame (hours, days, weeks, months, years), volume, performance compared with the market, moving averages, momentum (rate of change) indexes, and oscillators.

Preparation of stock charts can be an extremely time-consuming process. But *Telescan Analyzer* offers an efficient software alternative by enabling investors to retrieve charts through their PCs in a flash.

PC FILE

Telescan Analyzer

Telescan, Inc.

11011 Richmond Avenue, Suite 600
Houston, TX 77042

(800) 624-9307

List Price: \$395

Connect Charges: \$5 to \$10 per hour depending on time of day and location.

Subscription Fee: \$300 per year. First year's subscription is included in initial package price.

Requires: 256K RAM, one double-sided disk drive, color graphics adapter with monitor, Hayes Smartmodem 1200 or compatible.

CIRCLE 678 ON READER SERVICE CARD

With *Telescan Analyzer*, you can access Telescan, Inc.'s on-line database, which includes charts depicting up to 12 years of price data and fundamental and technical information for over 6,500 stocks. For each stock, you can graphically display price and volume data from 1 month to 12 years, moving averages, cycles, momentum, on-balance volume, relative strength, trend lines, book value, dividends, earnings, cash flow, capital spending, inflation adjustment, insider trading, and short interest.

Rather than retrieving 1 day's data at a time and then plotting it on the screen, *Telescan Analyzer* creates and displays a chart for any time period you request. This method saves you a significant amount of chart preparation time.

Telescan is simple to use. After you

insert the disk, the program automatically dials the database and signs you onto the system. *Telescan* then presents you with a four-option menu: What's New, which lists prices for connect times and other changes in the system; Auto-Run, which allows you to automatically log on to the Telescan database, collect the data for the stocks you want, and then automatically log off; Stock Graphs; and Exit Database.

Stock Graphs

With the Stock Graphs option, you are asked to select a stock. You can enter either the stock's ticker symbol or the partial or full name of the stock you want to view. The screen will then clear, and in less than 30 seconds a graph of the stock you selected and the main menu for the

FINANCE

stock will appear together on-screen.

The graph consists of bars, each measuring the high, low, and close of the stock price for the program's default time period. Volume for each period is shown at the bottom of the screen.

If you want to change the time span for the data shown, you simply press any number from 1 to 10 to display 1 to 10 years of data, or you can press the function key that corresponds to the number of months of data you want. The Telescan database contains information back to January 1973. You can display the full history of a stock by simply pressing the equal sign key.

Menus are displayed adjacent to the stock graphs at all times and list the keys you must press for each available feature. From the main menu that appears next to each chart, you can choose several submenus that will allow you to change or calculate various technical and fundamental indicators.

Any Indication

You can also select six technical indicators from the main menu: moving average, cycle analysis, momentum, on-balance volume, relative strength, and trend line marker. You have six fundamental indicators with which to analyze stocks: book value, dividends, earnings, cash flow, capital spending, and a composite of these five fundamental indicators. Three additional indicators you can use are adjustment for inflation, insider trading, and short interest.

Moving averages is one of the most popular techniques for analyzing stock

A cycle analysis plots the cycles of stock prices to determine when a stock might peak or bottom out.

and market trends. These averages smooth out price fluctuations, thus making trends easier to identify. Using Telescan's moving average feature, you can graph one or two standard or exponential moving averages over a specified time. You can also graph the difference between the moving average and the

closing price or the difference between any two moving averages. The resulting oscillator graphs can identify buy and sell signals wherever the curve crosses the neutral line.

On a color monitor, each moving average is shown in a different color, making it easy to pick out buy and sell signals.

A cycle analysis plots the cycles of stock prices to determine when a stock price might peak or bottom out. Telescan can display a stock graph with a sine curve overlaid. It can expand or contract the sine curve, shift it up, down, left, or right, and increase or decrease its amplitude. Telescan can also indicate, at the bottom of the screen, the period of the cycle and the dates for the top and bottom of the next cycle.

The program calculates on-balance volume for the stock of your choice by adding volume to the previous value when the stock price closes higher than the previous price and subtracting volume from the value when the stock closes lower than the previous price. If the stock price falls to a new low and the on-balance volume line does not, the indicator is interpreted as positive. If the stock price rises to a new high and the on-balance volume line does not, the indicator is interpreted as negative.

Trendy Tools

A quick look at any stock chart will reveal that prices move in trends and that quite often a series of either top or bottom stock prices can be joined by a straight line. These lines, known as trend lines, are simple but important chart analysis tools; they are reliable about 80 percent of the time in predicting reversals in stock trends. A reversal in a stock trend is indicated when daily stock price averages go significantly above or below the appropriate trend line.

You create trend lines using the arrow keys; you can move a marker right, left, up, and down until you get to the point you want to mark. After marking two tops or two bottoms, you press a function key and the trend line is drawn through the two marked points.

Book value per share is a company's net worth divided by the number of shares outstanding; the book value ratio

is the stock price divided by the book value per share. *Telescan*'s book value analysis allows you to plot the book value ratio showing the highest and lowest values for the time span chosen.

Telescan lets you retrieve and plot graphic information with consummate ease and speed.

You can quickly identify when a stock is undervalued, that is, selling below its book value.

Telescan uses the highest and lowest ratios of stock price to book value to draw overvalued and undervalued lines on the stock graph. The resulting screen shows clearly the stock's actual value against its book value.

Dividend yield is the current stock price divided by the sum of the last four quarters of dividends. The dividend yield choice in *Telescan*'s dividend submenu displays the dividend yield history for the stock you are examining.

Telescan will also display the history of a company's price/earnings ratio—its current stock price divided by the sum of the previous four quarterly earnings per share.

Officers, directors, and large stockholders of public companies are required to report to the Securities and Exchange Commission the details of their transactions in their company's stock. Insider transactions are broken down into open market purchases, open market sales, and exercise of options. *Telescan* lets you select which of these transactions you wish to have included in the insider indicator plot.

Insider trading is an important factor to consider when you're weighing a stock's value because insider buying and selling often precedes major stock price movements, thus making these graphs of particular value to investors.

While on-line, you can save the graphs to disk so that viewing and analysis can

be done off-line when you are not paying connect-time charges.

Telescan lets you retrieve and plot graphic stock information with consummate ease and speed. Its menus are al-

ways visible, and you have one-key-stroke control for virtually every function. The combination of technical and fundamental analyses make *Telescan* a valuable tool for any investor. ■

ORGANIZERS

Bellsoft, Inc. has introduced a series of low-cost, memory-resident programs called **Pop-Ups** with features not normally found in low-cost desk organizer software.

Chief among these features is the software's ability to place a copy of DOS within a user-defined RAM partition. This RAM DOS access function, called **PopDOS**, permits the user to interrupt an application to run DOS commands, other **Pop-Up** modules, or other applications software, then return to the first application at the point of departure.

The various **Pop-Up** modules are available separately or as an integrated **Pop-Up DeskSet** or **Pop-Up DeskSet Plus** package. The modular approach permits the user to add only those functions needed, avoiding the memory penalty associated with keeping rarely used functions within a RAM partition. Separately, the modules include:

- **PopDOS**—Performs DOS commands from within an application. This module includes **Pop-Up Anything**, a window-based menu for accessing other **Pop-Up** functions or other applica-

Pop-Up DeskSet, Bellsoft, Inc.

tions programs.

- **Pop-Up Notepad** with **Pop-Up Clipboard**—An on-screen text editor with a cut-and-paste facility allowing the user to capture up to one screen of data at a time for transfer to another application.

- **Pop-Up Calculators**—Two separate calculators, each equipped with ten memories and a printable tape. The standard calculator function features percentage calculations and a dollar mode and can transfer its figures directly into an application. The extended financial/statistical calculator adds routines and modes for handling interest, annuities, loan amortization, standard deviation, correla-

tion, and more.

- **Pop-Up Calendar**—Displays either scrollable 3-month calendars or detailed 1-month calendars with important dates noted, for any year from 1900 to 2027. It can note appointments, holidays, or special events, track cyclic events, print calendars, and date-stamp applications.

- **Pop-Up Alarm Clock**—Provides up to six alarms with a message for each, and a repeatable five-minute "snooze" option. It can display the time each minute, each hour, constantly, or not at all. It can work silently or sound a tone each hour. It also offers a multiple-event stopwatch and can time-stamp applications for

log-keeping purposes. Lastly, this module can do timed "feeds" of commands to cause DOS or an application to perform tasks unattended at user-specified times.

- **Pop-Up Voice**—Dials telephone numbers from the keyboard, a stored phone list, or a database file without exiting the application on-screen. This function, included with the **DeskSet Plus** package, is presently not compatible with the IBM PC AT or PCjr.

(List Price: **Pop-Up DeskSet**, \$69.95; **Pop-Up DeskSet Plus**, \$129.95; separate **Pop-Up** modules, \$19.95-\$39.95, depending upon functions)

Requires: 128K RAM (more recommended), one disk drive, PC-DOS 2.0.

Potomac Industries's **DiskPorter** is a portable diskette holder that also serves as a copy stand. The slim-profile storage case can be mounted on a wall or stored in a desk drawer. As its name implies, it can also

New on the Market Submissions Guide

Owing to the high volume of new product materials received each week at *PC*, all submissions to *New on the Market* should follow these guidelines:

1. Include the retail price and details of both hardware and software needed for an end-user to properly use your new product. This includes required amount of RAM, number and type of drives, operating systems supported, and peripheral equipment needed.
2. Releases should be typewritten double-spaced on one side of the paper. Copies of advertisements may be included, but in most instances we need more information than is typically included in an ad. Include telephone contacts for marketing and technical questions.
3. If available, include black & white glossy photos of the product, 4 x 5 inches or larger.

New on the Market does not review products; do not send sample or demo copies of software. All product announcements are run on a space-available basis, at the exclusive discretion of the editor. Please note that it is impossible to guarantee publication of a product announcement for any particular issue.

be carried in a briefcase. Its stair-step design ensures that each disk's label remains visible, allowing the user to access the correct disk without rummaging through the entire collection.

Flipping back the DiskPorter's clear plastic cover converts the storage unit into a convenient desktop copy stand, allowing maximum use of available desk space. Two index cards can be inserted within the clear cover for indexing the enclosed disks.

ACCESSORY EQUIPMENT & SUPPLIES

Golden Bow Systems has announced a new IC chip permitting users of the Iomega Bernoulli Box to boot their PC systems directly from the cartridge drive.

The chip, designated the **FIXT/B PLUS**, also permits the use of standard PC-DOS fixed disk commands with the Bernoulli Box, and cartridges can be partitioned for non-DOS use. The **FIXT/B PLUS** chip can be installed on the Iomega Host Adapter for IBM PC, PC-XT, and PC AT use.

PRINTER UTILITIES & EQUIPMENT

Users of the Okidata 92/93 dot matrix printers can access a range of print features without installing "Plug 'n Play" chips with the **Superoki Software Package**. Among the advantages provided by the software is the retention of several Okidata print features that are normally lost with the "Plug 'n Play" chips.

The **Superoki Software Package** permits such features as 96-character lines, downloadable character sets, and rapid setting of such print parameters as margins, tabs, print size, and line spacing. Graphics screens can be dumped to the printer much as text screens can, with sideways print dump also possible. Graphics images are printed in up to four shades of black and white in a 320 x 200 dot resolution mode.

(List Price: \$36)
Requires: 64K RAM, one disk drive, PC-DOS, Okidata 92 or 93 printer.

PC users wanting to create monochrome screen graphics without a color/graphics card might consider the **Monographx** program from Analytics International. Unlike other graphics programs, **Monographx** does not require color, though it will support color/graphics adapters and monitors if present.

The software uses both function keys and pull-down menus to aid the user in creating organizational diagrams, flow charts, and

Gantt charts. It offers a choice of 19 different fill patterns and allows text to be mixed freely with graphics images.

Images can be moved, mixed, or saved independently at will, within or across files. An Undo command permits accidental erasures to be recovered easily.

Created images can be printed with a graphics dot matrix printer. Compatible printers include the IBM Graphics Printer, Epson FX/MX series with Graftrax, C. Itoh Prowriter, and the Okidata 92, 93, and 84 with "Plug 'n Play" chips.

An included on-line tutorial, **TeachMe**, contains six lessons on creating graphics.

CIRCLE 622 ON READER SERVICE CARD

CPAids, Inc. has released a financial data management package for home use called the **Personal Planner**. The program can calculate tax liabilities for 1984-1987, organize all relevant tax data into an easily retrievable form, and aid the user in such tasks as retirement planning, investments, IRA contributions, home buying, two-income planning, and verifying federal tax forms.

For any given year, the Personal Planner stores up to four different sets of assumptions about an individual's financial status. The program can project expected income into the future and show the long-term implications of current financial decisions. For example, the program can help the user determine whether it would be better to take payment for the sale of a property in one sum or as a series of

installments over a period of years.

Most of the commonly used federal income tax forms and schedules have been incorporated into the software, permitting the user to determine earned income credit, itemize deductions, and perform other tax preparation calculations from data that is stored in its files.

(List Price: \$49)

Requires: 64K RAM, two disk drives, PC-DOS. CPAids, Inc. 1061 Fraternity Cir. Kent, OH 44240 (216) 678-9015

CIRCLE 621 ON READER SERVICE CARD

Additionally, the UPTA 96 modems feature automatic "fallback" to 7,200 or 4,800 bps under noisy line conditions, with automatic adaptive equalization.

Both modems currently in the series are compatible with communications programs that can operate at 9,600 bps and use the Hayes "AT" commands. The UPTA 96 Integral is designed to fit the expansion slots of the IBM PC for PC-to-PC communications. The UPTA 96/S is the standalone model that connects to either PCs or mainframes via RS-232 ports.

(List Price: UPTA 96 Integral, \$795; UPTA 96/S, \$895)

Electronic Vaults, Inc. 8350 Greensboro Dr., #714 McLean, VA 22102 (703) 883-0331 (703) 883-0332

CIRCLE 620 ON READER SERVICE CARD

COMMUNICATIONS

Electronic Vaults, Inc. has introduced the **UPTA 96 Modem** series, a line of 9,600 bits-per-second modems in both standalone and plug-in board configurations that fit short or full-size expansion slots in the user's PC. The modems can operate asynchronously over dial-up phone lines, or connect directly to PC-Mainframe network installations via RS-232 lines.

The UPTA 96 modems offer half-duplex operations at 9,600, 7,200, and 4,800 bps, and feature autodial, autoanswer, and Hayes command compatibility. Internal firmware supports a proprietary Ensured Data Integrity (EDI) protocol that makes use of numerically sequenced data packets and cyclic redundancy checks.

Miracle from Micro-Systems Software provides an integrated, multifunctional approach to PC-mainframe communications. Incorporating word processing, spreadsheet, and graphics functions, the software permits the user to download data from mainframe systems and manipulate the data without leaving the program. The various functions can be accessed via multiple windows through the software's *Agenda* command system. This command system also permits the user to "teach" the software repetitive tasks for automating operations.

Personal Planner, CPAids, Inc.

UPTA 96 Modems, Electronic Vaults, Inc.

Miracle's ability to "learn" tasks is further enhanced by PAL, a built-in procedural language that permits the user to enter complex operations as a command file. With PAL commands, Miracle can do such tasks as access an on-line database, search for data via user-defined criteria, and retrieve the data in a format compatible with the software's spreadsheet, word processing, or graphics components, without user intervention.

The software's spreadsheet component offers worksheets of 256 rows by 64 columns; up to four of these worksheets can be opened concurrently through screen windows. This allows the user to create three-dimensional worksheet configurations with advanced mathematical, trigonometric, statistical, financial,

logical, and calendar calculations available.

Miracle's graphics component offers two-color palettes or monochrome fill patterns for creating pie charts, bar graphs, area graphs, and high-low-close investment graphs. Both the spreadsheet and graphics components can make use of the built-in word processor for producing complex reports incorporating numerical graphs. After manipulation, the communications component permits the data to be uploaded to any system on-line.

INPUT/OUTPUT DEVICES

Welch Allyn, Inc. has produced a bar code interface on a single half-size board that can be fitted in any IBM PC expansion slot without software or hardware modifications. The HBD-100 Interface board's 9-pin port accepts digital scanner input and automatically discriminates between five major bar codes: code 3-of-9, CODABAR, Interleaved 2-of-5, UPC, and EAN. Data entered into the user's system via the attached scanner appears to the user's application as keyboard input.

Among scanner choices also available from Welch Allyn are an infrared LED wand with high or low resolution and a visible light LED wand with high or low resolution. Bidirectional scanning speed ranges from 3 to 30 inches per second, depending upon the type of code. Additional options for the board include bar

code printer and serial interfaces.

(List Price: With scanner, \$695)

Dialogic Corp., makers of the DIALOG series of voice recognition and synthesis boards, has introduced a collection of software tools for making effective use of voice I/O in an applications system. Called the Voice Toolbox, the collection is comprised of five separate modules, available together or separately. These five programs include:

- **VBASE**—A program for the creation and management of a database consisting of words and phrases to be used by the DIALOG boards.

- **CallStat**—A program

HBD-100 Bar Code Interface, Welch Allyn, Inc.

Dialogic Voice Toolbox, Dialogic Corp.

for monitoring phone line status during a call.

- **DIME** (Dialogic Intelligent Modem Emulator)—Allows the DIALOG boards to emulate the Hayes Smartmodems.

- **DOSTools**—An aid for quick development of voice I/O applications without regard to the programming language used.

- **SPTools**—A collection of utilities that perform various signal-conditioning operations on a voice file.

DIME and **CallStat** can only be used with the DIALOG/2 and DIALOG/3 boards because of the necessary communications functions built into these boards. The remaining modules in the *Dialogic Voice Toolbox* can be used with any of the DIALOG boards.

(List Price: All five programs, \$150; separate modules, \$50 each)

Requires: DIALOG series voice I/O board.

TEMPLATES, UTILITIES & PROGRAMMING

Riverdale Systems Design, Inc. has announced five template programs for Lotus's 1-2-3 as part of its *Hospital's Workplate* software series. The five programs are designed to automate various aspects of hospital administration and performance evaluation. The individual templates in the package include the following titles:

- **Hospital's Market Analysis Workplate** templates analyze the demographic characteristics of the region surrounding the hospital. Additional capabilities allow for projections of hospital use based on various indicators, the exploration of population methodologies, and the application of national averages to the particular region.

- The *Hospital's Medical Staff Workplate* analyzes the characteristics and use patterns of the institution's medical staff. Quartile analyses identify the most active physicians; other

studies correlate patterns of hospital use with various physician characteristics. The template also aids in pinpointing the regionwide availability of medical specialties and can provide projections of needed medical staff under various "what if" scenarios.

The third release, the *Hospital's Utilization Workplate*, analyzes historical use trends and projects future use. Inpatient, ambulatory care, and ancillary services are studied for up to 5 years, with detailed analyses for single-year periods. Special reports are also generated for selected tertiary services.

The *Hospital's Departmental Planning Workplate* aids in the operational planning of each department's space needs. Utilization levels are surveyed and ratios applied to provide guidelines by department, outlining the space required given the number of procedures and treatments to be performed.

The fifth program, the *Hospital's Financial Projections Workplate*, helps to determine the financial outlook of the institution for a period of up to 5 years. The templates produce profit-and-loss/income statements, cash flow analyses, and balance sheets, allowing the institution to compare its performance to that of others. (List price: *Market Analysis, Medical Staff*, and *Hospital Utilization* programs, \$295 each; *Departmental Space Planning* and *Financial Projections*, \$195 each)

HIGH RESOLUTION GRAPHICS

Do you need straighter lines and rounder circles than can be obtained from typical medium resolution packages?

CONSIDER THE DRAWING TABLE™

The Drawing Table uses the 640 x 200 pixel mode to provide high quality lines, circles, rectangles, squares, triangles, parallelograms, isosceles, and arcs.

In addition to standard figures, the block function allows moving, copying, or erasing rectangular areas with the ability to enlarge, overlay or replace the new block.

Painting is easy with 100 different brush sizes in four different shades.

A library function is provided to store commonly used symbols. This allows the creation of specialized libraries to draw flowcharts, schematics, process flow etc. (A flowchart library is included).

Drawings may extend to multiple screens and can be labeled with the text function.

Drawings can be saved to disk or dot matrix printer.

The Drawing Table is menu driven with all functions selected by a single keystroke. Requires IBM PC/XT/AT or compatible with 162K color graphics board, and DOS 2.0 or later. \$49.95 + \$3 shipping VISA/MC (TN - 725%).

GET FREE INFORMATION!

Of all the products advertised in this issue of PC Magazine, there are dozens you'd probably like to know more about. Handfuls you might be interested in buying.

Now you can have pertinent, comprehensive information about these products right at your fingertips, and it won't cost you anything. Only a minute of your time.

The manufacturers and distributors of these products have colorful and informative literature available. If you're interested in receiving these brochures, PC's Reader Service Program can help.

Simply follow the instructions described below and PC will forward your requests for information to the appropriate advertisers. Before you know it, you'll have a complete and handy product reference file.

Getting free information about products advertised or mentioned in this issue of PC is as easy as 1-2-3.

- 1.** Each ad in the magazine includes a reader service number. (These numbers are repeated on the advertiser index, as well.) If you'd like more information about the product or products described in a particular ad or feature, circle the corresponding number on the attached card.
- 2.** Fill in your name and address in the space provided. Please: only one card per person.
- 3.** Mail the card today...it's postage paid. And watch your information file begin to grow.

NOTE: This card is to be used for product information or subscriptions only. Editorial inquiries should be directed to PC Magazine, One Park Avenue, New York, NY 10016.

Now is also an ideal time to become a PC subscriber. See the back of this card for details about our special offer for new subscribers.

**IF YOU ARE A
PROFESSIONAL PC
USER...**

**IF YOU SEE THE
PC AS AN INVESTMENT
OR IMPORTANT
BUSINESS TOOL...**

**IF YOU WANT TO
MAXIMIZE YOUR PC
PRODUCTIVITY...**

**HERE IS A SPECIAL
OFFER YOU WON'T WANT
TO MISS!**

Now you can receive 24 biweekly issues of PC Magazine for only \$21.97—less than 92 cents an issue!

The money PC will help you save will cover the cost of your subscription more than ten times over!

How?

In PC Magazine, you'll find in-depth and thorough product reviews that will help you make informed and appropriate buying decisions.

You'll learn about innovative applications...project management, communications and graphics...and how to put them to use on your PC.

You'll hear industry news first-hand, and how forward-thinking professionals are using their PCs to further their business goals.

What's more, you get all this information every two weeks, giving you a decided edge over colleagues who rely on a monthly publication.

Your subscription to PC is your guarantee of the most up-to-date and comprehensive coverage of innovations and applications that will help you maximize the performance of your PC.

So don't miss out. Act now on PC's special offer and get 24 issues for only \$21.97. Fill out the attached reader service card and check the subscription box. Or, call toll free, 1-800-852-5200.

HANDS OFF COMPUTING.

THE FIRST \$2,000 SPEECH SYSTEM FOR ONLY \$450.

Introducing AudioPilot™ — the complete voice interface system for use with the IBM® PC, XT, and compatibles. We call it "hands-off" computing. With AudioPilot, your IBM can respond to voice commands, making all your applications faster and easier to use.

AudioPilot™ works with Lotus 1-2-3,™ VisiCalc,™ Multiplan,™ pfs,™ MultiMate,™ and probably all the software you own, and interfaces with a mouse, giving you total control over your system. Other features include voice controlled auto-dialing with a Hayes® modem, voice mail capabilities, and a computer controlled voice storage and playback.

The system installs in under two minutes and saves you hundreds of hours. Best of all, this complete speech system sells for only \$450!

Discover AudioPilot and "hands-off" computing. It's something to talk about.

Dealer and Distributor inquiries welcome

AudioPilot, 102 Wall Wyckoff Rd., Huntington, NY 11746 (516) 351-4866

DISK MECHANIC

The ULTIMATE Backup, Analyze & Repair Utility
The Disk Toolkit NO IBM PC Should be Without
Protects Your Software Investment

BACKUP TOOLS:

- Can Backup Most Every Diskette
- SUCCEEDS where others fail!
- Works Manually or Automatically
- Create "Protected" Diskettes
- Many Additional Analysis Tools

FILE TOOLS:

- Show Disk & File Allocation
- Display & Alter File Date
- Repair Damaged Disks
- Recover Erased Files
- Alter "Hidden" Status
- Search Files For Data

SECTOR TOOLS:

- Examine/Print Sector Data
- Modify (ZAP) Sector Data
- Compare, Copy & Zero Sectors
- Search Sectors For Data

HACKER TOOLS:

- Modify Floppy Disk Controller Parameters
- Supports All FDC/R/W Commands

DISK MECHANIC works with all standard IBM PC disk formats including "protected" diskettes with mixed track and sector sizes, blank and high track formatting, CRC errors, and single or double sided drives. DISK MECHANIC requires an IBM PC with 128K of memory or COMPAQ with 128K of memory, DOS 1.10, and 2 floppy disk drives. DISK MECHANIC includes a detailed 48 page instruction manual. To Order: DISK MECHANIC send check or money order for \$70 plus \$3 for shipping (Mass. res. add sales tax.) to: MLI MICROSYSTEMS, Box 825, Framingham, Mass. 01701 or Call (517) 926-3085 for Mastercard or VISA orders. Dealer/Distributor inquiries welcome. ©1983 MLI MICROSYSTEMS.

Database Series Begins

PC Tech Journal begins a series on data management products that will continue into 1986. *PC Tech Journal* editors invested months developing a template for writing the reviews, which cover the most significant data management software on the market today. Taken as a whole, the reviews will enable technically sophisticated developers creating applications for the nontechnical user to easily select the best product for a specific application.

Each product review will be organized the same way and reviewed according to a set of specifications. Each will run a substantive application and its performance will be measured.

COBOL Compilers

PC Tech Journals coverage of COBOL Compilers culminates with an in-depth review of three compilers: IBM COBOL 1.0, mbp COBOL 9.0, and Micro Focus Professional COBOL. Along with the final review, we'll take a comprehensive, comparative look at all the compilers in this series: DRI Level II COBOL 3.0, Micro Focus Level II COBOL 2.62, Microsoft COBOL 2.0, Realia COBOL 1.2, and RMCOBOL 2.0B.

More Tools for C

PC Tech Journal will conclude its series on Tools for C with a report on three C software libraries for data communications programming.

Improving Turbo's I/O

Soon to come in *PC Tech Journal*: an I/O library that cures Turbo Pascal's deficiencies in file and screen handling.

Silicon Valley Days

Two new books, one a glowing history and the other a less-than-suspenseful espionage story, present two very different views of California's Silicon Valley.

It's a wonder any work gets done in Silicon Valley, what with all the self-satisfied techie millionaires counting their money. At least that's what you might think if you failed to give *Charged Bodies* a chance. At first, Thomas Mahon's hyperbolic portrait of California's high-tech wonderland is hard to swallow. His comparison of Silicon Valley's Renaissance to fifteenth-century Florence is dubious and his description of the Valley as a "state of mind" is overblown.

But if we accept the unabashed chauvinism that Mahon brings to his subject, it becomes easy to enjoy *Charged Bodies*. On first examination the book may appear simply to rehash the now-familiar profiles of the microcomputer industry's brightest entrepreneurs. Many of these people do figure in the story of Silicon Valley, but Mahon does not limit himself to the microcomputer world. He also reports on the extraordinary proliferation of scientific endeavor in the area and how it has dramatically affected and changed

a once-pastoral community of plum and apricot growers.

Silicon Implants

Although a few technological companies did locate in the northern Santa

two colleagues left to found Intel, the company that is chiefly responsible for developing the microprocessor.

Mahon, a public-relations specialist in San Jose, adopts the style of a good investigative reporter and includes a variety of people and interests in *Charged Bodies*. After tracing the charter of Silicon Valley back to Fairchild, Intel, and other companies, he returns to the present to let those who live and work in the Valley have their say. Many of these people are involved in businesses that complement and support the early companies. Others are academics, observers, theologians, and even watchdogs alert to possible environmental or social abuses.

Give Me a Profile

In profiling these Valley-ites, Mahon provides background information, then lets his subjects speak for themselves. We benefit, therefore, from nontechnical explanations of, for example, the economic principles at play in venture capitalism, the basics of semiconductor theory, and the ABCs of genetic engineering. The people profiled have strong opinions and, to his credit, Mahon does not tamper with them.

In speaking about the business of venture capitalism, for example, financier James Anderson suggests that Silicon Valley backers are tied to technological companies by choice. Anderson is "emotionally married to high technology," he claims. "I think it's great fun. I don't think of it as a way of making money . . . money is simply the way we keep score."

Clara Valley in the 1930s and 1940s (notably Hewlett-Packard), Mahon credits William Shockley with starting the heavy influx of scientific enterprises. Shockley grew up in the area and after leaving AT&T's Bell Labs in 1955, located his own semiconductor firm in Palo Alto. After a while, some of his engineers, including Robert Noyce, "defected" to form Fairchild Semiconductor. While at Fairchild, Noyce coined the integrated circuit. In 1968, Noyce and

CIRCLE 638 ON READER SERVICE CARD

But then we hear from Ted Smith, a lawyer whom Mahon labels an environmental activist, who is concerned about chemical pollution of the aquifer that supplies 60 percent of Santa Clara Valley's drinking water. Smith is worried about the social consequences of the Valley's transformation as well. "There are human casualties . . . whether it's Atari laying off nearly 2 thousand people with little or no notice, or the day-to-day grind of the production jobs. This is certainly one of the wealthiest areas in the world, yet the public school my first-grader went to last year closed due to a lack of sufficient money."

Mahon also pays tribute to the patriarchs of Silicon Valley. Leland Stanford probably had no idea that the university he started in 1840 would become a magnet for many of the country's most forward-thinking scientists. Frederick Terman, an eminent professor at Stan-

ford since the 1930s, did much to guarantee that the university became a center of high technology. Terman tells the story of David Packard and William Hewlett, two of his students who started an electronics business in Packard's garage.

Charged Bodies is an easygoing book that offers science, history, business, popular culture, and even some music and art. Thomas Mahon clearly did extensive research and, wisely, talked to many people before he sat down to write. But I'm not yet ready to concede that Silicon Valley is a state of mind. It's simply a pleasant place with a great climate where a lot of very smart people have put their heads together.

Espionage In the Silicon Valley

It would be great to recommend *Espionage in the Silicon Valley* as an antidote to the largely optimistic *Charged Bodies*. This slim Sybex paperback by John D.

Halamka tries to show the seamier side of a world that is usually depicted as a land of opportunity for quick-witted entrepreneurs. However, some people also make impressive, if illicit, fortunes by stealing trade secrets and products from the companies owned by those entrepreneurs. Little attention has been paid to these thefts, even though they frequently result in exciting sting operations and dramatic trials.

In *Espionage in the Silicon Valley*, Halamka explains that the type of crime afflicting high-technology companies is a new strain that cannot be fought by traditional law-enforcement methods. For one thing, the atmosphere in which products are designed and developed is highly volatile. Big money is at stake, and pressures are almost unbearable. Competition is so stiff in Silicon Valley that even a day's delay in a schedule can jeopardize a product's success.

These adverse circumstances can work together to make a company particularly vulnerable to theft, often from within its own walls. But such a company may be reluctant to invest in an adequate security system, an expense they may view as unnecessary overhead. Taking precautions against a theft problem is an admission that the problem exists. A company that is on shaky financial ground doesn't want to frighten stockholders or alert competitors.

Local Yokels

Halamka goes on to explain that because of the nature of the products involved, local police may not be equipped to participate in the normal way. Perhaps they don't fully understand the value of the stolen materials.

Silicon Valley crimes are often fraught with suspense and international intrigue. Millions of dollars may change hands under a table. There's even been one known murder. A book that compiles and analyzes some of these real-life whodunits should be a spellbinder. Unfortunately, *Espionage in the Silicon Valley* is an unsatisfying example of the genre.

Halamka first offers an overview of the problem in a brief introduction. The information that he presents here about the production of microchips and the kinds of things that can go wrong is useful and interesting. However, the main part of the book that follows, case studies of five crimes committed against Silicon Valley companies in the last decade, is almost impossible to follow and overwhelmed by unnecessary detail. The facts are disjointed and sometimes don't add up. The text is wearisome.

Espionage in the Silicon Valley is poorly edited and riddled with typographical errors. Its dense design makes it difficult to read. Surely more editorial attention could have been given to this

potentially compelling subject.

Terry Nasta is a technical writer for Informatics, a large software development company in New York City.

LATTICE® WORKS

LATTICE TOPVIEW TOOLBASKET RELEASED

If you develop programs oriented to take advantage of IBM's TopView multi-tasking window environment, you need the Lattice TopView Toolbasket.

The Lattice TopView Toolbasket is a library of more than 70 C functions to control window, cursor, and pointer functions, along with printer controls, cut and paste functions, debugging, and general utilities. It also includes an assembler interface and master file and data definition headers.

This new Lattice product speeds your program development with its documented tips on handling I/O and dispatch routines, plus its sample programs with source code and batch files your programs can be patterned after.

The Lattice TopView Toolbasket runs on the IBM PC, XT, AT, and compatible systems with 256K (512K and TopView Toolkit from IBM recommended). The Lattice TopView Toolbasket is available for \$250. Binary and Source Code available for \$500. The Lattice TopView Toolbasket was developed for Lattice by Strawberry Software.

Speed your TopView program's release. Order the Lattice TopView Toolbasket today!

UNICALC COMPONENT SPREADSHEET SOURCE KIT CHOSEN BY ORACLE

Lattice, Inc. and Oracle Corp. have jointly developed SQL-Calc, a unique product based on Lattice's UNICALC spreadsheet program and the ORACLE Database software.

SQL-Calc gives users the ability to extract and manipulate database information using spreadsheet features made popular by programs such as VisiCalc, SuperCalc, and Lotus 1-2-3. SQL-Calc is the first full-featured spreadsheet to be coupled so closely with a powerful relational database to give users the ability to treat SQL database access statements like normal spreadsheet formulas.

The UNICALC Source Kit, used to develop SQL-Calc, is a component electronic spreadsheet kit for UNIX, MS-DOS, PC-DOS, and other systems that support the C language, and is available to other program developers. It allows program developers to incorporate electronic spreadsheet features into new or existing software programs. UNICALC also gives users many display options and will generate printed reports in a variety of formats which may be saved for further manipulation by a word processing system.

The UNICALC Source Kit is available with a wide range of royalty and licensing arrangements at very competitive pricing. Call Lattice, Inc. at (312) 858-7950 to discuss your applications.

LATTICE C COMPILERS CHOSEN BY MORE THAN 26,000 SOFTWARE DEVELOPERS!

The top-selling C compiler, Lattice C, is now published directly by Lattice, Inc.

When you purchase our edition, you get support directly from the people who wrote the C compiler. You also get free "bug fix" updates during the warranty period. When you register your purchase with us, you are notified of all updates, enhancements, and new C programming tools as they become available. And, as with all Lattice products, you are covered by a money-back guarantee.

When you are ready to purchase a C compiler, consider the source. Then call us: Lattice, Inc.

3M Scotch® DISKETTES

Now, the lowest prices ever on

LIFETIME WARRANTY!

The best deal on 3M diskettes you've ever seen!

FREE!

FLIP N' FILE 15 with every order for 5.25" SSDD and DSDD.

\$1.42 ea. — 5.25" SSDD with FREE Flip N' File 15
5.25" DSDD with FREE Flip N' File 15 — \$1.74 ea.

100% LIFETIME WARRANTY

This is a Super Special promotion. It was supposed to end around the end of May.

But we decided to buy more than 1,000,000 3M diskettes packed in the FREE Flip N' File 15's... and give you the benefits of this terrific value.

One word of warning: this offer is limited only to supplies on hand. Once these supplies are used up, the prices stay the same... but there's no free Flip N' File.

The last time we ran an offer like this, everything was sold out in about six weeks.

So don't wait. Order now.

Other 3M diskettes:

(Flip N' File offer does not apply.)

5.25" SSDD-96TPI \$2.06 ea.

5.25" DSDD-96TPI \$2.57 ea.

5.25" DSDD-HD for

IBM PC/AT \$3.93 ea.

3.50" SSDD-135TPI for

Apple Mac \$2.86 ea.

DATA CARTRIDGES

100% certified 3M data cartridges.

DC-1000 \$13.90 ea.

DC-300XLP \$19.83 ea.

DC-600A \$22.13 ea.

Sold in cases of 10 only

Add \$5.00 shipping per 10.

Coming Up

Word Processor Roundup

In the 4-year history of the IBM PC, word processing software has appeared on the market at a staggering rate of nearly one package per week. Your purchasing decisions probably don't take this many products into account, but the sheer number of packages on the shelves make word processor shopping a confusing experience. In this issue, *PC Magazine* evaluates 18 of the most popular PC word processors, ranging from one \$10 gem to a few several-hundred-dollars behemoths. We'll take you through a typical word processing day at the keyboard with each program and then compare and chart its features as well as tell you how fast it performs the most-common tasks. Writer Phil Wiswell ties it all up with some of his own conclusions.

And More Word Processing

Word processors that can automatically index and generate a table of contents save writers both time and money. Dara Pearlman compares three powerful word processors, *Word Perfect 4.0*, *XyWrite II Plus*, and *WordStar 2000 Plus*, according to their ability to perform these two laborious and painstaking tasks.

Price Waterhouse Report

The spreadsheet can be a logical and efficient tool for handling small-scale accounting needs. *CPA+* is a 1-2-3 template package that makes spreadsheet accounting a breeze. It integrates four major accounting functions: general ledger, accounts payable, accounts receivable, and payroll management.

LANs on a Disk

LANLink and *EasyLAN* are new products that combine special software with your general-purpose RS-232C hardware to give you local-area networking abilities at lower-than-LAN prices. *PC Magazine* tells you how one of these might just be the product to meet your office networking needs.

Sanyo Portable Computer

What's better than a PC-compatible portable microcomputer? A PC-compatible portable microcomputer with a built-in color/graphics monitor, that's what. The Sanyo MBC-775 is this and more. We'll tell you if it's ready for business—and for travel.

New Columns

Upcoming issues of *PC Magazine* will feature two new regular columns: "Quantum Leap," by Ron Jeffries, and "Computers in Society," by Stan Augarten.

Trainers, Training Directors

*Decrease Development
Time and Costs!
Increase Quality!*

Que, publisher of bestselling computer books, introduces a series of professional materials for hands-on instruction of popular business programs.* The most complete materials in the industry, from instructor's guide to slides. Everything you need to get started—without the time, without the effort!

*1-2-3, Symphony, dBase III, MultiMate, WordStar 2000; also materials for introducing the PC, XT, and DOS

Available through a site license, each set of materials includes:

- Comprehensive Instructor's Guide
- Transparencies
- Color Slides
- Student Workbooks & Disk
- Student Reference Books
- Complete Course Outlines
- Preclass Questionnaires
- Evaluation Forms
- Extra Exercises to Supplement Workbooks

QUE™

If you believe these simple facts about hard disks, you'd be willing to pay more for ours.... fortunately, you won't have to

Avoiding hard disk failures and loss of data is just one of the reasons to buy our hard disks.

Hard disks can fail—there's really no other nice way to say it. Even IBM has problems delivering ATs with hard disks that work. We're not talking about nice, clean, clear-cut failures where the drive seizes up, coughs, and rolls over and dies. We're talking about the insidious little creeping failures that sneak up over time—like a missing sector here or a lost sub-directory there.

There are precautions you can take to protect against failure and ultimate loss of data. Here is what we contribute toward minimizing the potential loss of your data.

Best Drives Available

First, we buy the best drives available. Sounds trite, doesn't it? I mean, a drive's a drive—right? Hardly. You should see some of the junk we get in our labs. Some have such high failure rates that we even questioned our own \$10,000 hard disk tester. But when we tested other manufacturers' drives we were assured that our equipment was fine, which just confirmed that the bad hard disks were not only bad—they were real bad.

But that's just the weeding out process. We then take each drive that we've put through our tester and test it again with the controller you've requested. We call this a "tested pair."

DOS Doesn't Do It

In case you're thinking that all

this is an unnecessary duplication of what DOS does for you, let me explain the disk facts of life.

If DOS did what you may think it is supposed to do when you format the disk, DOS would map around these bad areas. Unfortunately, DOS doesn't do this.

DOS 2.0 and 2.1 can't enter the bad tracks. DOS 3.0 can, but only on the IBM AT. Unfortunately, as the press has so well documented, the AT's hard disk develops bad tracks later on.

We do what DOS can't

We believe the problem is so bad, we use a software program that performs a powerful test of your disk drive on all of the IBM or IBM compatible computers—PCs, XT's, and AT's. Our format takes hours to analyze the disk. But when we finish, you know that the bad tracks are really mapped out so you won't write good data that will disappear into a black hole. We even send you a printed statement of our test results.

Our software allows you to type in the bad track locations from the list supplied by the manufacturers, so you'll never write good data to them—even if DOS didn't identify them as bad. The software even lets you save the location of these bad sections to a file, so that you can reformat your disk without spending hours retesting.

We even include a program that will give you continuous comments on the status of your hard disk. No more waiting for that catastrophic failure.

Average Access Time

As you might suspect, some hard disks are faster than others in their ability to move from one track of data to another. The time it takes the hard disk to move one-half way between the beginning of the disk to the end is called the "average access time."

The first generation of 10 megabyte hard disks had average access times of 80-85 milliseconds (msec). But computer users love speed, and guess what—the average access time for the new 20 megabyte hard disk in the IBM AT is only 40 msec. (We sell an AT equivalent with only 30 msec access time!)

There are some legitimate reasons for the shorter access time. It's particularly helpful when there are multiple users on the same hard disk. It's also important when running a compiler. But remember, before you get too wrapped up in the access speed, there's always that ST 506 interface which won't let data transfer from the hard disk to the computer any faster than 5 megabits/second. We've bypassed that choke hole, too. If you want the functional equivalent of a Ferrari with a turbocharger, order our 10 Mbit per second 108

megabyte hard disk with 18 msec of average access speed.

Compatibility

To be sure that your hard disk is 100 percent compatible with the IBM XT you don't need to buy the same hard disk that's in the XT. You can't even be sure what brand hard disk it is because IBM, like Express Systems, goes into the marketplace and buys hard disks from several vendors. However, they buy their XT hard disk controller from only one vendor—the same one we do.

You can buy the IBM XT controller from IBM for \$495 or you can buy from us, the functional equivalent, manufactured by the same company that makes it for IBM for only \$195. Is it the exactly identical IBM XT controller? No, it's better. First, it takes less power, and secondly, it can control from 5 to 32 megabytes—the IBM controller can work with only 10 megabytes. It is 100 percent IBM XT compatible, and 100 percent is 100 percent. If you want to save a slot, we carry a version that lets you operate two hard disks and two floppy disk drives.

More than 32 Megabytes

You can operate with more than 32 megabytes (the limit of DOS) through the use of "device drivers." Express Systems can supply you with device drivers for our hard disks for over 32 megabytes formatted. But, if you don't have individual files, or databases that are large, you might want to consider one of our controllers that can divide our 65 megabyte (formatted) hard disk into two equal volumes of 32 megabytes each.

Reliability

We offer you a choice between iron oxide and plated media—the stuff that covers the hard disk and gives it its magnetic properties. Iron oxide is...well, it's rust. If you inadvertently joust your disk, you may cause the low flying head to dig out some iron oxide. A little rust flake can ruin your whole day. Plated media is more resistant to damage, and if it happens, less data is lost.

We offer both types of hard disks. The iron oxide is older

technology, and quite frankly, manufacturers understand it better. Their better understanding, combined with some of the special head locking mechanisms, gives us peace of mind when we sell you one.

Power

Hard disks consume power. Our small, half-high hard disks consume so little power that you can use them with your existing IBM PC power supply. If you plan to use lots of slots, you'll want to increase your power supply to be safe. We offer the same amount of power for your PC that comes in the XT.

Our Customers

Some folks just never feel comfortable buying mail order. They forget that Sears began as a mail order house or that IBM is now into mail order. But, if it helps, here is a *partial* list of customers who have felt comfortable to buy from us.

IBM	Sears
American Express	Honeywell
U.S. Army	MIT
AT&T (Bell Labs)	RCA
Bausch & Lomb	Lockheed
Xerox	Sperry

Easy to Install

If you're like most of us, raised on the boob tube rather than the Great Books, you'd rather see the movie than read the book. Well, now you can choose to read our installation manual or for only \$9.95 more, you can get a VHS or Beta video cassette showing the simple steps for installation.

Our VHS or Beta Cassettes make installation easy.

Warranty

We offer you a one year warranty on our hard disks—the same as IBM on the AT and 90 days on the tape drives. (It's all the manufacturer gives us.) If

More questions?

Because we spend so much attention on the front end with ensuring that our disks will arrive in working order, we have a customer service department that, unlike many of our competitors, has little to do. When you need us, you won't get a constant busy signal.

Call our friendly, knowledgeable customer service staff to get answers to your questions—before or after the sale. Our people, who know the PC, can talk you through the sticky parts, and they'll respond to you quickly. Just call us.

How to order

Pick up the telephone and call 1-800-341-7549, to order. We accept Master Card, VISA, American Express and Diners Club. Or send a cashier's check or

money order (We'll take a check, but you'll have to wait for it to clear) and tell us if you want one of our recommended configurations or you want to mix and match yourself. Corporations with a DUNS number may send purchase orders for quantities over five.

CIRCLE 115 ON READER SERVICE CARD

Introducing the Most Powerful Business Software Ever!

TRS-80™ (Model I, II, III, or 16) • APPLE™ • IBM™ • OSBORNE™ • CP/M™ • XEROX™

The VERSABUSINESS™ Series

Each VERSABUSINESS module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™

\$99.95

VERSARECEIVABLES™ is a complete menu-driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALEDGER II™ and VERSAINVENTORY™.

VERSAPAYABLES™

\$99.95

VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record on each vendor, prints checks, check registers, vouchers, transaction reports, aged payables reports, vendor reports, and more. With VERSAPAYABLES™, you can even let your computer automatically select which vouchers are to be paid.

VERSAPAYROLL™

\$99.95

VERSAPAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on screen for operator approval. A payroll can be run totally, automatically, or the operator can intervene to prevent a check from being printed, or to alter information on it. If desired, totals may be posted to the VERSALEDGER II™ system.

VERSAINVENTORY™

\$99.95

VERSAINVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSAINVENTORY™ keeps track of all information related to what items are in stock, out of stock, on backorder, etc. stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly or to link with the VERSARECEIVABLES™ system. VERSAINVENTORY™ prints all needed inventory listings, reports of items below reorder point, inventory value reports, period and year-to-date sales reports, price lists, inventory checklists, etc.

VERSALEDGER II™

\$149.95

VERSALEDGER II™ is a complete accounting system that grows as your business grows. VERSALEDGER II™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system **without any additional software.**

- VERSALEDGER II™ gives you almost unlimited storage capacity (300 to 10,000 entries per month, depending on the system),
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALEDGER II™ comes with a professionally-written 160 page manual designed for first time users. The VERSALEDGER II™ manual will help you become quickly familiar with VERSALEDGER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

CIRCLE 260 ON READER SERVICE CARD

SATISFACTION GUARANTEED!

Every VERSABUSINESS™ module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any VERSABUSINESS™ module, you may return it within 30 days for a refund. Manuals for any VERSABUSINESS™ module may be purchased for \$25 each, credited toward a later purchase of that module.

(Full Height series)
P-10I Port 10 Mbyte
Internal for Portable
P-10e & P-20e
10 & 20 Mbyte
External series

The mass memory market has become a real battle zone! Chaos, confusion and buyer uncertainty have resulted from too many products and not enough answers.

The truth of the matter is, anyone can sell a winchester disk drive. The problem is that hard drives, by their own nature, are sensitive devices that require appropriate handling and customer support.

Don't be misled into believing that a disk drive can be sold and booted around the country, without any risk.

There is no room for the weak, when it comes to delivering a product you can depend on!

Peachtree Technology Inc. has cleared the path of confusion with a comprehensive line of mass memory expansion systems that have established themselves as leaders in advanced hard drive technology, backed by strong customer support. Every Peachtree Technology Inc. product has been through stringent diagnostic testing as a complete system, to assure they not only meet, but surpass specifications. (On the outside of every box is a documented certificate of inspection signed by our techni-

clan). Plus we stand behind our products with a complete one year parts & labor warranty.

FLEXIBILITY AND COMPATIBILITY A MUST!

To eliminate frustration, Peachtree Technology Inc. has provided a complete line of mass memory storage systems. They are fully compatible with IBM PC, XT & PORTABLE, AT&T, CORONA PORTABLE, COMPAQ DESK PRO & PORTABLE, COLUMBIA, TAVA, ZENITH 150 AND MANY MORE. (If your computer is not listed, please contact us for further information).

We offer a complete line of products including:

- External winchester hard drives • 10, 20, and 30 megabyte (formatted capacity). Our 10 and 30 megabyte drives utilize a hard carbon coating on the disk platter surface.
- Internal mounted winchester hard drives • 10, 20 and 30 megabyte (formatted capacity)
- Removable hard disk • Half height winchester, 10 megabyte, utilizing new and advanced head positioning technology.
- Cartridge tapesystems • Capacity - up to 60 mbytes • Half high 5.25" form factor add-in/add-on to IBM-PC and compatibles.

- A 135 watt internal power supply that replaces the standard unit in the PC.

We'll supply everything you need to give your micro new speed and storage capacity: Disk drive, controller cables, software, and associated custom firmware.

One stop shopping for your mass memory requirements.

Don't become a victim! The frustration and inconvenience of not having customer support may not be worth the few dollars you save buying from an unreliable source. There is no substitute for a complete hands on demonstration and face to face commitment to customer service from a reputable dealer. So don't be left standing in the smoke. To find out more about Peachtree Technology Inc. and our complete line of memory expansion systems, ask your local computer dealer for a complete demonstration. If he does not have our products have him call 404-662-5556, and we will deliver a demonstration unit & literature within 24 hours!

Introducing MAESTRO ATTM

The Multifunction Board That Fine Tunes Your IBM PC-AT

If you own an IBM PC-AT, or if you're considering a purchase, you should know: the most cost-effective multifunction board on the market is Maestro—offering savings of up to \$1500 per board.

Whether you're using SymphonyTM, working with spreadsheets or dialing into a data network, you'll find that Maestro's functionality and simplicity make it the kind of computer tool you won't want to be without.

Maestro has a prodigious memory.

Two memory blocks give you a range of memory that allows you to upgrade your PC-AT from 256K or 512K to nearly three megabytes. Then put all that memory to work running large business software programs. Supporting multi-user, multi-tasking systems like XENIXTM. Processing large routine programs quickly. Or accommodating RAM disks at will.

The basic design is so sound, you can almost forget about maintenance.

Our innovative one-card design provides full 1" spacing for optimum cooling, unlike piggy-backed cards.

Installation couldn't be simpler.

Maestro eliminates as many as 14 separate switches found on other boards, and offers maximum versatility in memory configurations.

You'll applaud the versatility.

Maestro's parallel port and serial port handle all the peripherals you're likely to need. The serial port's built-in connectors eliminate costly cable converters for maximum savings.

Maestro comes with a valuable accompaniment.

To increase its value to you even more, every Maestro board comes with a complimentary Treasure ChestTM of software. The 24 business productivity programs include a calculator, a security system, memo pad, electronic address book, calendar, and hardware diagnostics.

With Tecmar, you can always expect an encore.

Tecmar developed the very first peripherals for the very first IBM PC. We've been building our expertise, our product line and our reputation for service ever since.

If you like the sound of all this, we suggest you see your nearest Tecmar dealer for a closer look at the Maestro board. To find out who your local dealer is, call us at 216/349-1009.

Available in
quantity now!
